

Zenoss Core

Network Monitoring

Today's businesses demand 24x7 uptime of IT infrastructure. To meet this need, a number of technologies are used, which include fail-over, clustering, redundant devices and high availability. Despite having more fault-tolerant and rugged technology, devices still do fail. Similarly, despite advances in software reliability, sometimes services are prone to failure. Therefore, monitoring important hosts, devices and services (Network Infrastructure Monitoring) is an essential task in any IT infrastructure. Learn more about Zenoss Core, a FOSS tool for monitoring applications, networks, servers and more.

Proprietary network infrastructure monitoring software includes CiscoWorks LMS, Dyan Network Management System, IBM Tivoli Network Manager, etc. There's also a variety of open source network monitoring software available like Nagios, OpenNMS, Zenoss, etc. These cater to wide-ranging requirements, from just monitoring network traffic (Ntop), capturing packets for analysis (Wireshark), and infrastructure monitoring, to

monitoring the entire network (various devices, hosts, services, applications, etc.).

About Zenoss Core

According to the official website, the Zenoss project was started by Erik Dahl, a long-time network engineer, who had worked on numerous commercial network-monitoring systems. Zenoss Core delivers functionality to effectively manage the configuration,
