

issues. This security feature would not include built-in storage as well as external storage cards (like microSD, etc). Also, Samsung would work to get the Cisco AnyConnect VPN service to run on its smartphones. And finally, the company would also partner with Sybase to get its Afaria Advanced Enterprise Security (AES) that helps to centrally manage all of the devices in the network. In simple terms, your IT manager could encrypt your phone, remotely lock or wipe the entire data on the Android device or enforce a stronger password apart from being able to do other things.

As for Motorola, recent reports from Bloomberg indicate that the company has bought 3LM, a small software start-up founded by ex-Googleers (actually Android-ers) that specialises in enterprise applications, where security might be one of their core focus areas.

Fujitsu, Oracle to make next-gen UNIX

Fujitsu and Oracle have come together to strengthen their decade-old partnership and design the next generation of UNIX servers. The new partnership would also include a new distribution agreement. Under the new agreement, Fujitsu would upgrade its SPARC64 processor and combine it with Oracle's operating system to make the next-generation of UNIX servers.

The companies announced that upon completion the new servers would be six times faster than any of the current variants. By 2014, UNIX servers that are mostly used in banks and financial institutions would be 15 times faster than today's versions.

The servers would be available in the second half of 2012. Apart from contracting to manufacture the new servers, Fujitsu has also acquired the rights to sell Oracle's database and other services.

Kinect hacked to work with Android

Kinect has been in the news ever since its launch, because of its market-destroying lack of a joystick or wireless support. Recently, Kinect has gone open source and many developers have been able to simulate virtual 3-D environments (like that in 'The Minority Report') using Kinect as a device. All of this points to Kinect being a relatively easy device to hack. The newest news coming in is of a hacker successfully getting Kinect to work with Android.

Although too many details on this feat are not available, since the hacker has refused to share any code that makes this work, it is a great achievement, nonetheless. A video, shot by the developer himself in all probability, shows the camera on the Kinect recognising his hand and playing the video on the Armadillo brand of Android tablet that the developer used. It is still very buggy and slow; however, over time, this looks like a great way to control games on Android.

We sincerely hope the guy releases the code for open development so that you, our readers, can try your hand at fine-tuning it.

Twitter for Android updated!

Android's official application for Twitter has been updated. The new version brings several UI changes that make it look more polished and sophisticated. You can check for current trends even without signing in. You can also create a new account directly via the app. It also features cleaner interface with tabs for replies, mentions, tweets, etc. **END**
