

communication to battery-operated mobile devices such as smartphones, tablets, eBooks and industrial PDAs. We intend to continue sharing our expertise with regular OpenLink submissions to the Linux kernel—where TI can work collaboratively to strengthen these solutions.”

OpenLink wireless connectivity drivers are compatible with open source development platforms such as BeagleBoard, PandaBoard and other boards. Whether working with Android, MeeGo or other Linux-based distributions, developers can now access code natively as part of their kernel builds to introduce the latest low-power wireless connectivity solution into their products.

Additionally, community support and resources are available 24/7 via the active OpenLink community on www.openlink.org.

Aurora ‘Dev’ channel for Firefox launched

Mozilla has launched its Aurora ‘dev’ channel for Firefox, which will allow developers and early adopters to test the latest features and innovations being added to the browser. According to Mozilla, the aim of the change is to “...deliver new releases of Firefox faster and give users more opportunities to participate in building Firefox.”

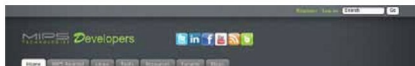

Sources at the non-profit organisation say, “The Aurora channel is where users can test the latest features and innovations. Users can expect an increase in polish from the raw, cutting edge features in our nightly builds. Aurora releases may not be as stable as beta or final releases.”

MIPS launches resource site for developers

MIPS Technologies, a provider of processor architectures and cores for digital home, networking and mobile applications, has launched its new Developer Community at developer.mips.com. The new site is specifically tailored to the needs of software developers working with the Android platform, the Linux operating system and other applications for MIPS-based hardware. All information and resources on the site are openly accessible.

“This new community demonstrates our ongoing commitment to the vibrant open source effort around the MIPS cores and architecture, as well as around our customers’ and their customers’ hardware platforms,” said Art Swift, vice president of marketing and business development, MIPS Technologies. “As the MIPS architecture continues to expand into new high-volume markets such as mobile handsets and tablets, we see an increasing need for these resources among the growing MIPS developer community,” he added.

source community manager—Wireless Connectivity Solutions, TI. “We’re enabling built-in kernel access to TI’s latest WiLink combo solutions, bringing low-power wireless
