

Adobe announces SDK for Photoshop Touch

Adobe has announced the release of an SDK that would let developers create Photoshop Touch-based apps for the iOS, Android and Blackberry platforms. Adobe has already shown the way with its apps Color Lava, Eazel and Nav developed for the iPad.

The new SDK works in tandem with CS5 and a new scripting engine. It lets devices on Android, Blackberry and iOS interact with the desktop-based Photoshop. Adobe has already created three apps for iOS—Adobe Color Lava, Adobe Eazel and Adobe Nav. The new SDK would let developers write similar apps for Android, BlackBerry, etc.

Developers looking to try their hand at this SDK can head to: <http://www.adobe.com/devnet/photoshop.html>.

Renesas Electronics joins Linux Foundation

Renesas Electronics, a supplier of advanced semiconductor solutions, including microcontrollers (MCUs), systems-on-chip (SoC) solutions, and a range of analogue and power devices, is the Linux Foundation's newest member. The Japanese company is investing in next-generation automobiles, mobile phones, set-top boxes and other increasingly sophisticated electronics that are running Linux. For example, Renesas recently announced new SoCs for next-generation mobile phones and for dashboard-mounted car navigation systems that support advanced human machine interfaces (HMI).

Renesas will contribute to Linux Foundation activities in the areas of embedded Linux and will participate in the Consumer Electronics (CE) working group and LinuxCon Japan, among other activities. The Consumer Electronics Linux Forum (CELF) merged with The Linux Foundation late last year to form the Consumer Electronics (CE) working group and align resources to more efficiently enable the adoption of Linux in the CE industry.

AMD hiring Android driver development engineers

AMD is looking for software engineers to develop drivers for the Android OS—an indication that the company might be considering chipsets for notebooks, tablets and netbooks that can run Google's popular mobile platform.

"The Linux Base Graphics team is looking for Android driver development engineers to help us evolve our driver stack for new platforms and in line with the development trends in the Android ecosystem," reads the job description on the company's website. "Experience with video decode acceleration within the Android Web browser or video player applications would be an asset. Experience with

Novell expands LTSS programme for SUSE Linux Enterprise Server

Novell has expanded its Long Term Service Pack Support (LTSS) programme for SUSE Linux Enterprise Server, increasing the time period for which customers can access the company's Linux support for each service pack release. For the first time, long term support is also provided globally for SUSE Linux Enterprise Server for System z.

The company has also announced the immediate availability of SUSE Linux Enterprise 10 Service Pack 4 (SP4), bundling all previously released patches, fixes and updates for SUSE Linux Enterprise 10, while supporting the newest hardware, storage systems and networking devices, including Intel's latest Xeon E7 processor family and AMD's latest Opteron processors.

Novell's updated LTSS offering enables data centre customers to stay on covered releases longer than other Linux distributions. The ability to run workloads for an extended time on one service pack helps enterprises mitigate risk by minimising changes to mission-critical workloads, allows more time to migrate to a future release of SUSE Linux Enterprise, and defers the costs associated with updating and testing.

"Our customers have made it clear that the long-term support of their Linux platforms is critical to their business," said Markus Rex, senior vice president and general manager—Open Platform Solutions, Novell. "The extension of our support programme and the release of SP4 for SUSE Linux Enterprise 10 provide important benefits for data centre operators, giving them UNIX-calibre lifecycles for their critical workloads. Across the full spectrum of physical, virtual and cloud environments, SUSE Linux Enterprise backed by Novell services is delivering exceptional value while helping customers further reduce risk," he added.
