

WebM and/or OpenMax would be a bonus," the site elaborates. (Sponsored by Google, WebM is an audio-video format designed to provide a royalty-free open video compression format for use with HTML5 video. OpenMAX is a royalty-free, cross-platform API that provides comprehensive streaming media codec and application portability by enabling accelerated multimedia components to be developed, integrated and programmed across multiple operating systems and silicon platforms.)

Firefox 4 available on Maemo and Android phones

Mozilla has released the final version of Firefox 4 for Mobiles for the Maemo-powered Nokia N900 and various Android devices. According to the developers, the mobile version of Firefox "...delivers an intuitive interface, unparalleled customisation and support for modern Web technologies."

Firefox is now available from the Android Market and for download on Maemo devices. Firefox for Mobile is offered in more than 10 languages.

According to the developers, "Firefox for Mobile allows users to take the Firefox experience they love everywhere and minimise typing with features like tabbed browsing, bookmarks, add-ons and Firefox Sync. With a sleek new look that hides browser controls when not in use, Firefox allows users to focus on the websites they visit. Firefox Sync gives users seamless access to their browsing history, bookmarks, open tabs, form data and passwords across computers and mobile devices. Firefox also offers thousands of ways to customise the features, functionality and look of mobile Web browsing with Firefox Add-ons."

Firefox is up to three times faster than the stock browser on Android. Major enhancements to the JavaScript engine make everything, from the page load speed and graphics to overall performance, snappy in Firefox.

Firefox for Mobile is built on the same technology platform as the desktop version. With modern Web technologies like HTML5, developers can build rich, interactive applications and websites.

Jolicloud Desktop now has access to Google Docs

Jolicloud, which boasts of one of the cutest names in cloud computing, now has Google Docs too. Following up on its integration of Dropbox, Jolicloud has added support for the online office suite, so you can access and edit documents directly from the Jolicloud File Browser.

Follow these simple steps mentioned on the Jolicloud blog to set the new feature up: "Just go to the File Browser and click 'Google Docs' in the left sidebar. Then click 'Link to my Google Docs' and on the next screen, log into Google and grant Jolicloud access to Google Docs."

Google updates Android for enterprise use

Google has decided to update its Google Apps policies to make Android more relevant to enterprise usage. New features include rights to administrators and the ability to track your device and remotely reset or wipe the password.

For starters:

- Google has updated its Google Apps Device Policy that enables users to locate their Android 2.2+ device on a map, ring the device and/or reset the device password remotely.
- IT admins would have the option to encrypt the data on your device which now requires encryption on Android 3.0 tablets.
- Google Apps Lookup will act as an internal database to search for colleagues/contacts and communicate with them.

With every update, not only is Android getting more secure for the average user but it is also making it easier to manage your work and personal life without the need to carry two separate devices.

Project Harmony launches website

Project Harmony, a community-centred group focused on contributor agreements for free and open source software (FOSS), has launched its website at harmonyagreements.org in May 2010. Project Harmony believes contribution agreements are "...one available tool out of many in an overall legal strategy for FOSS developers..." but notes that although they are seeking to improve how they work, "...it doesn't imply that we think they are a necessary part of all FOSS legal strategies."
