

The Scent of an Ebook

A plastic Ebook reader can never match the majesty of a gold-embossed book jacket. The Ebook format, however, has some advantages—both in terms of enhanced convenience for the reader, and easier accessibility to publishing and distribution for the author. Read on and learn how to produce your own Ebook in the EPUB format, using FOSS tools.

An Ebook will never smell as good as that old leather-bound volume of classics on grandfather's bookshelf; but the Ebook format, residing inside an Ebook reader, will let you carry that entire volume in your pocket.

Before we get into the creation of an Ebook, should we not get a feel for what browsing an Ebook feels like? Download the Mozilla add-on for reading EPUB books, and point your Firefox browser to one of the many sites that host DRM-free EPUB content (see References). You will note that with this add-on, you can not only read EPUB Ebooks, but also create a repository of your favourite Ebooks, either as saved local copies, or as bookmarks in Internet repositories.

EPUB is an open Ebook format developed and maintained by the International Digital Publishing Forum (IDPF). It is a zipped container format; if you change the extension from *.epub* to *.zip*, you can open it with an archive manager. Among other things, it contains a manifest of the contents, metadata information, and the book's content as files in the XHTML 1.1 format.

We will not go into the intricacies of the format here—rather, we will concentrate on a work-flow to produce an EPUB Ebook that passes standard-compliance checks. You can learn more about the EPUB format from the IDPF website.

Preparing the content

Since the content of the book is stored as XHTML, the shortest way to an EPUB book should start from a good WYSIWYG editor for XHTML. We will begin with OpenOffice Writer, because it gives us a familiar tool to work

with and maintain the original source of our Ebooks. Our work-flow lets you concentrate on your book, rather than fiddle with the format. Another advantage of starting from OO Writer is that ODF serves as a good parent format from which you can re-purpose your content as a PDF document, a Web page, or (as in this case) an EPUB Ebook. But for those of you who wear see-through wrist watches to admire the mechanisms as much as to read the time, we will briefly discuss a more direct approach, later on, which assumes a knowledge of the EPUB format and XHTML/CSS. That said, you can use any word-processing tool here that generates good HTML or XHTML in the end.

The first tip is to keep things basic and uncomplicated. Too many bells and whistles can irritate the reader, and even confound the Ebook reader software or device. All our tips apply to OO Writer, unless otherwise noted.

- **Ebook title:** In OO Writer, use the document properties form (under *File > Properties...*) to enter the name of the document or Ebook. This becomes the title of the Ebook you are producing.
- **Headings:** Have at most two levels of hierarchy for headings—one for chapter headings, and another for sub-headings within chapters (if you need them). In OO Writer, as a style guideline, choose *Heading 1* as the style for chapter headings, and *Heading 2* for sub-headings. These translate to the HTML elements `<H1/>` and `<H2/>` respectively, in the Ebook. The rest of the text can be *Body Text* or the equivalent. This discipline also helps generate a proper and correct 'Table of Contents' for the Ebook.
