

Figure 5: EFY item selected

Figure 6: LFY item selected

```
beginTransaction();
ft.replace(R.id.the_frag, testFragment);
ft.setTransition(FragmentTransaction.TRANSIT_FRAGMENT_OPEN);
ft.addToBackStack(null);
ft.commit();
}
```

Now, set up the fragment class, *TestFragment*. We initialise the position of the clicked item from the list to a variable, *magznumber*. As discussed earlier, if a fragment is being associated with a UI, then the *onCreateView()* method is used to inflate the view to the fragment. Here, create a linear layout for the fragment, and then load it with the appropriate image of the magazine in an *ImageView*, and this *ImageView* is added to the linear layout:

```
public View onCreateView(LayoutInflater inflater, ViewGroup
container, Bundle savedInstanceState) {
    Context c = getActivity().getApplicationContext();
```

Figure 7: FFY item selected

```
LinearLayout l = new LinearLayout(c);
LayoutParams params = new LayoutParams(LayoutParams.WRAP_
CONTENT,
    LayoutParams.MATCH_PARENT, 0);
l.setLayoutParams(params);
ImageView i = new ImageView(c);
switch(magznumber){
    case 1:
        i.setImageResource(R.drawable.efymag);
        break;
    case 2:
        i.setImageResource(R.drawable.lfymag);
        break;
    case 3:
        i.setImageResource(R.drawable.ffymag);
        break;
}
l.addView(i);
return l;
```

Figures 5 to 7 show some screenshots of the application when it is deployed; in turn, they show the application with the *Electronics For You*, *LINUX For You* and *Facts For You* list items selected, with the corresponding image loaded in the *ImageView*.

This application can be taken to the next level by embedding a *WebView* instead of an *ImageView*, and launching the selected magazine's website. If you need any help while trying out recommendations mentioned in this article, you can contact me at <http://goo.gl/RueFj>. Happy coding!
