Figure 2: Setting the block position

The meaning of *$op == "list"* is that when Drupal invokes the 'list' operation, it is requested to show all the block(s) listed down here, with their information. You can set the position of your block using the options given in the combo box, as shown in Figure 2.

Now, to show the recent blogs in the block, add the code below in place of *PlaceHolder#1* in the code above, indenting it as required:

```
$block_content = '';
$today = getdate();
$start_time = mktime(0, 0, 0,$today['mon'],
$today['mday'], $today['year']);
$limitnum = variable_get("recentblogs_maxdisp", 3);
$query = "SELECT nid, title, created FROM " .
      "{node} WHERE created <= '%d'" .
      " order by created desc";

$query_result =  db_query_range($query, $start_time, 0,
$limitnum);
while ($links = db_fetch_object($query_result)) {
      $block_content .= l($links->title, 'node/'.$links->nid) .
'<br />';
}
$options = array( "attributes" => array("title" => t("More
blogs...") ) );
$link = l( t("more"), "recentblogs", $options );
$block_content .= "<div class=\"more-link\">" . $link . "</div>";
$block['subject'] = 'Recent Blogs';

if ($block_content == '') {
      $block['content'] = 'Sorry No Content';
```

Figure 3: Block display

Figure 4: Main page

```
}
else {
      $block['content'] = $block_content;
}
```

The above snippet of code will fetch the node IDs and their titles for the period prior to today. The number of results fetched is limited by the parameter *$limitnum*, which is configurable; it can be modified using the *Settings* page for this module. If the number of results are more than this value, then a *'more'* link is shown below the list (see Figure 3). Clicking *'more'* will take you to the main page of this module.

Creating a main page for the module

The following function contains the code for the main page. And since it is the main page, *$limitnum* is not used to limit results. See Figure 4 for an example of the output.

```
function recentblogs_all() {
      $page_content = '';
      $today = getdate();
      $start_time = mktime(0, 0, 0, $today['mon'], $today['mday'],
$today['year']);
      $query = "SELECT nid, title, created FROM " .
        "{node} WHERE created <= '%d' " .
        " order by created desc";
      $queryResult =  db_query($query, $start_time);
      while ($links = db_fetch_object($queryResult)) {
```
