

KNOWHOW?

QA & SECTION

Recently, I installed openSUSE 11.3 on my laptop from the DVD bundled with *LINUX For You*. Till a few days back everything was running perfectly. However, now, when I minimise any window, instead of showing up on the bottom panel, it simply disappears.

I have tried everything that I know, but haven't been able to resolve the issue. Currently, I am using the 'Alt+Tab' key to switch between applications. I am using the GNOME desktop environment as my default desktop. Kindly help me resolve this problem.

—Anoop Kumar,
anoop8721@gmail.com

Follow the steps given below to resolve the issue of the disappearing windows.

Step 1: Right-click on your bottom panel and click on 'Add to Panel'.

Step 2: Then scroll down in the 'Add to Panel' window and select 'Window list'.

Step 3: Now, click on 'Add'.

You will be able to see your minimised applications on the bottom panel.

Recently, I installed FreeNAS 8.0 (Stable) on a 4 GB pen drive. The system is an Atom-based

computer with 2 GB RAM and two X 1 TB SATA hard disk drives. Using the option available in the FreeNAS configuration page, I successfully configured it as RAID 1—a software-based RAID. The system is working fine.

Now, I want to set up a system on the network to enable Windows XP or Windows 7 users to share a common folder to exchange data. At the same time, I want each user to have their private folder on the NAS server.

Although I followed the instructions on the site to configure the CIFS share, I was unable to do it. Also, I could not locate any option to browse and select the folder that could be assigned to users while creating the CIFS share. Please suggest how I can set up the CIFS share?

—Santosh Gupta,
san_gupta83@rediffmail.com

To address your query, we tried setting up a similar system and encountered no issues in creating a Windows Share (CIFS). We worked on the FreeNAS 8.0.1 Beta4.

To do this, you need to locate a 'Browse' button for the path in the window, which pops up to configure the CIFS share.

We suggest you update your system to this release (FreeNAS 8.0.1 Beta4) and then try again. There are chances that the FreeNAS 8.0 Stable release has some bug in it.

I am using Ubuntu on my laptop and want to install 'rdesktop' to access my remote Windows server. I have tried

installing it from the source file but the installation gets disrupted and shows some errors, which I am unable to decode.

How do I install this application on my laptop?

—Neha Raj,
mail4neharaj@yahoo.in

With the information given above, I would suggest you install 'rdesktop', using the Ubuntu package manager. You can run the following command from the terminal to install it:

```
sudo apt-get install rdesktop
```

Also, you would need 'tsclient' on your system.

Run the following command to install 'tsclient':

```
sudo apt-get install tsclient
```

Hope this resolves your problem.

I have an OpenOffice document file, which has too many notes/comments embedded in it. I just want to hide them so that I can read the document properly. I am using LibreOffice 3.3.1. Please suggest how to disable this feature in LibreOffice.

—Vandy Roshan,
tuxvan.roshan@gmail.com

To hide the notes/comments in the document, you need to go to the option 'View' given in the toolbar and click on 'Comments'. Clicking on the 'Comments' option again will make the comments reappear.
