

Ford launches OpenXC platform

Ford, in collaboration with Bug Labs, has launched the OpenXC plug-and-play platform. It has been designed to let third-party developers create any number of open source hardware or software products that will interact with Ford's sync system. According to K Venkatesh Prasad, senior technical leader of Infotronics at Ford Research and Innovation, OpenXC would enable outside developers to design new ways to extend the usefulness of the Sync system that is currently installed in more than 3 million Ford vehicles.

Free training on embedded Linux at Pune University

Oasis Education recently conducted a free training workshop in embedded systems at Dhule Patil College of Engineering for the faculty of the various engineering colleges of Pune University. The university introduced embedded Linux in the embedded systems curriculum for the electronics and telecom engineering students in response to the growing demand for embedded Linux in the IT circuit. The workshop was part of the corporate social responsibility exercised by Oasis Education with their experienced trainers participating in designing the syllabus. It delivered successful hands-on training on the ARM9 hardware boards.

Kitware gets two \$150,000 grants

Kitware, a company that creates and supports open source software and technology, has been awarded two \$150,000 grants from the National Institute of Health (NIH) in the US. The aim is to develop advanced software systems for enhancing digital pathology and remote-access microscopy.

Ubuntu soon to be on IBM mainframes

Canonical, Ubuntu's parent company, is collaborating with IBM in order to certify Ubuntu on IBM's high-end System P Power hardware line within a month and System z mainframes by the year end. Prior to this, Canonical had been successful in getting Ubuntu certifications for IBM's x86-powered System x and BladeCenter lines. This would be a major leap for Ubuntu as it has always lagged behind RedHat and SUSE in servers and cloud operating platforms, although it has been the leading Linux distro with individual users.

Intel, Google join hands for Android phones

Google has joined hands with Intel Corp. to develop software that will run on the chipmaker's mobile microchips. Google's popular software will be

digiKam 2.1 released

Version 2.1 of the open source digital photo management app features a new panorama tool, which is a result of this year's Google Summer of Code (GSoC). It enables users to stitch together multiple images to create large panoramas. This first point update also includes updates to the Kipi plug-ins and fixes for 50+ bugs. You can now download digiKam 2.1 from the project's site.

Intel says 'Yes' to open source, and 'No' to patents

Intel is giving an opportunity to US universities to host Intel Science and Technology Centers (ISTCs) that would be funded to the extent of \$2.5 million dollars annually for five years, with the condition that the universities open source any resulting software and inventions that emerge out of this funding. ISTCs will conduct research in areas related to cloud and embedded computing. Intel has further notified the universities to not file patents and release all significant software developed under an open source licence.

Chrome Web Store launched in India

Google has launched Chrome Web Store, a marketplace for Web apps and Chrome OS, the first browser-centric operating system, in India. The open marketplace provides Chrome users with an easy way to discover and try the best apps on the Web. The company first announced the launch of the Chrome Web Store in the United States nine months ago.

The search giant is now expanding and making the store available in 24 more countries, including India.
