

Will Russian president fund Windows' open source clone?

ReactOS, a free and open source Windows 'clone' has caught the attention of Russian President, Dmitry Medvedev. Marat Karatov, a ReactOS project developer, asked Medvedev for a million euros to give ReactOS the final touches, since the president found the project interesting. ReactOS is a community-driven international initiative and is fully compatible with all Windows-based applications, programs and services, unlike Linux and other non-Windows operating systems. According to developers, it runs all Windows programs, but is much faster than its Microsoft equivalent. If a standard PC Windows takes a minute to load, ReactOS will only take about 10 seconds. The project is currently in the experimental stage and needs a financial boost to become usable in the near future.

Dmitry Medvedev, president, Russia

Wind River Workbench On-Chip Debugging optimised for Intel architecture

Wind River has introduced a version of Wind River Workbench On-Chip Debugging that is optimised

for Intel architecture. The JTAG product delivers a debug solution enabling embedded device customers across a range of industries to develop more effectively and efficiently for Intel-based embedded platforms

Based on the Eclipse platform, Wind River Workbench On-Chip Debugging is a standards-based graphical debugging solution that simplifies the entire embedded development lifecycle and enhances developer efficiency.

Key new highlights include:

- Solutions optimised for embedded Intel processors including Intel Atom, Core and Xeon processors, targeted for embedded system development.
- Intel architecture views and utilities enable users to quickly assess the state of their platform, monitoring key elements such as descriptor tables, paging tables, virtual to physical memory mapping, PCI bus, and CPU and peripheral registers.
- Support for debugging loaded EFI modules and visibility into UEFI data structures enables developers to customise, optimise and debug boot-loaders, and BIOS.
- Serial peripheral interface (SPI) Flash programming streamlines the development process by eliminating the need to use a standalone flash programming tool.
