

“ The Summit was a tremendous source of open-source-related knowledge.

I work quite extensively on the open source technology stack, as I work in the embedded field. It was obvious that I would get curious and want to attend the CXO Summit when I got to know about it. My goal was to know about the developments in my field. Plus, with cloud computing becoming a hot technology trend, my desire to learn more only intensified.

Experiences at the CXO Summit 2010: The Summit facilitated interaction with participants, and was a tremendous source of knowledge on open source tools and processes, and also on the resources available in the cloud.

Tryst with Linux and open source: We work on the Linux platform and use open source tools such as GCC, Eclipse, OpenOffice, Uboot, etc. We are using open source Linux for some of our embedded boards based on Freescale, TI and ATMEI processors. Our main focus is on building customised solutions for the defence sector. We understand their requirements and design customised boards for their applications, and the customised firmware and BSP (board support package) for these boards.

Why I feel open source rocks for businesses: The key advantage of using open source is that we can develop customised solutions for our customers in an economical way, without any restrictions. Availability of abundant community support is another bright side of open source. Sometimes, we can find and straight away use tested/proven utilities (from open source) in our applications.

A word of caution: We may have to optimise Linux and open source code sometimes. But the good part is, adopting open source is manageable, as it is possible to seek community support as and when required for any troubleshooting.

A wishlist for the CXO Summit 2011: There could be more discussions on the usage of open source, Linux and security issues.

“ The Summit was really awesome for networking and learning about open source.

I had always been keen on building business networks and learning new things about open source. Luckily, I got to know about the OSI event as well as the CXO Summit while searching for open source meets in India, on Google. The event sounded appealing to me, and I instantly made up my mind to attend it.

Experiences at the CXO Summit 2010: The event provided a great networking environment to connect with peers, and excellent opportunities to learn new and interesting things about open source. This made the CXO Summit an awesome experience. The insights into the use of open source, which I got the opportunity to hear about during the event, were very useful. I am extremely thankful to the LFY and OSSCube teams for organising such events, and for promoting open source in India.

Tryst with Linux and open source: I have been using Linux for the past three years. We use Apache, MySQL, Perl, Python and PHP as programming tools. We also use OpenOffice and other Linux-based utilities in our office for day-to-day work.

Why I feel open source rocks for businesses: We always recommend that our peers use open source in their business. There are so many reasons for this. Open source is affordable, it has high-tech support from a very huge pool of developers and IT engineers from across the globe. Additionally, Linux boasts of ever-increasing performance, new features, and updates at a very fast pace, without any additional costs.

A wish-list for the CXO Summit 2011: Organisers should offer opportunities that enable people to network better, such as a networking lunch or dinner. This would be a splendid way to make the summit's environment more friendly and open. It will help in combining socialising with learning.
