QEMU installation in the zone was successful. You'll also notice that the core system now has a new virtual device `rtls0:1`, which will filter all traffic in and out of the isolated container:

```
root@openindiana:~# ifconfig rtls0
```

```
rtls0: flags=1000<UP, BROADCAST, RUNNING, MULTICAST, IPv4> mtu  
1500 index 3
```

```
inet 10.1.0.136 netmask fffffff0 broadcast 10.1.0.255
```

```
ether e2:62:0:a4:d5:24
```

```
root@openindiana:~# ifconfig rtls0:1
```

```
rtls0:1: flags=1000843<UP, BROADCAST, RUNNING, MULTICAST, IPv4> mtu  
1500 index 3
```

```
zone NewZone
```

```
inet 192.168.254.200 netmask fffffff0 broadcast
```

```

OI combines tools from the Linux world (*ls*, *bash*, *gcc*) and those native to Solaris (*svcadm*, *pfexec*, *newtask*, *beadm*). The CDDL licence (similar to GPL) made possible the emergence of the Nexenta distribution, which uses the OS/Net (OpenSolaris) core, much like OI. However, Nexenta has only GNU applications, and isn't built on mixed technology like OI.

However, as we have already seen, this mixed environment is closer to Linux than to Solaris. The use of interesting options like ZFS and zones lets you look differently at existing solutions in Linux—for instance, LVM and *lxc*. Who knows, maybe one day, we'll see a Linux distribution offering ZFS as the default root filesystem! **END**
