Codeigniter Part 1	Ankur Aggarwal

Figure 2: Output

Model file: /application/models/dbtest.php

```
<?php
class DbTest extends CI_Model {
    function createTable() {
        $query="create table `lfy` (article varchar(50), author
varchar(50));";
        $this->db->query($query);
    }
    function insert() {
        $insert=array('article'=>'CodeIgniter Part 1',
            'author'=>'Ankur Aggarwal');
        $this->db->insert('lfy',$insert);
    }
    function showAll() {
        $fetch=$this->db->get('lfy');
        $fetch=$fetch->result_array();
        return $fetch;
    }
}
```

Let's understand the code. Our 'DbTest' class extends the *CI_Model* class; this is needed to use certain APIs. The *createTable()* function creates the 'lfy' table with *varchar* columns 'article' and 'author'. Use the *query* method of the *db* instance member to run the SQL query. The *insert()* function creates an associative array whose key is the column name, and value is the data we want to insert. The *db->insert* method takes the table name and the data array as arguments. The *db->get* call is equivalent to a 'SELECT * FROM' SQL query. You can also pass an ORDER BY value like 'ASC' as the second (optional) argument. Now fetch results into an array and return it.

Controller file: /application/controllers/dbtestcontroller.php

```
<?php
class DbTestController extends CI_Controller {
    function index() {
        $this->load->model('dbtest'); #1
        $this->dbtest->createTable(); #2
        $this->dbtest->insert();
```

```
$data['records']=$this->dbtest->showAll(); #3
$this->load->view('dbtestview',$data); #4
    }
}
```

To use the *Model* and *View* in the *Controller*, you must load them, giving the file base name as the argument. Load the *dbtest* model, call its *createTable* and *insert()* functions, then assign the *showAll()* returned array to a 'records' attribute of the *\$data* variable, which you pass into the (loaded) view file. The 'records' attribute will be accessible as a '\$records' variable in the view file.

View file: /application/views/dbtestviews.php

```
<html>
<head>
<title>Db Test </title>
<meta charset='utf-8'>
</head>
<body>
<pre>
<?php
echo "<table border=5><tr><td>Article</td><td>Author</td></tr>";
foreach($records as $row) {
    echo "<td>".$row['article']. "</td><td>".$row['author']. "</td></tr>";
}
echo "</table>";
?>
</pre>
</body>
</html>
```

The above code is quite simple. After creating all three files in the browser, visit *localhost/ci2/index.php/dbtestcontroller*. You should see something like what's shown in Figure 2.

There are a lot of APIs in CodeIgniter that will speed up your development. Read up on it! I hope you will enjoy working with it. In the next part of this series, we will explore 'form' helpers, form validations, database checks and a little about tables. Feedback, suggestions, queries are always welcome!
