

OpenSUSE 12.3 released

The openSUSE project, the worldwide community that promotes Linux and creates Linux distributions, has released openSUSE 12.3. The latest version of openSUSE offers the integration of systems and delivers better system log experience with journals.

OpenSUSE 12.3 has been loaded with graphical package management tools and a new theme that brings consistent performance right from the boot to the desktop. The 1 GB live images have now been optimised for USB sticks, and the ARM team has readied stable OpenSUSE 12.3 ARM v7 and experimental ARM 64-bit images for this architecture.

According to a post on the OpenSUSE website, the latest desktop delivers faster metadata handling, a new print manager, provides improved Bluetooth integration in KDE's Plasma Desktop, improved notifications, better file management and account integration for Exchange and Windows Live in GNOME Shell.

Apart from the experiential features, the 12.3 comes with a host of new technologies like PostgreSQL 9.2 that has native JSON support (NoSQL style).

Now type in Hindi on your Android device

Now go *desi* while texting on your Android phone. Android has apparently

released its Hindi keyboard app, Google Hindi Input, which is available at Google Play.

The app is said to be compatible with any Android smartphone or tablet that runs Android 2.2 aka FroYo or later, which basically includes any phone or tablet that entered in the market in the last couple of years.

Other than a Hindi keyboard, the Google Hindi Input also adds English-to-Hindi transliteration mode, which means you can type in Hindi the same way as it is done in English. Transliteration mode basically converts the Hindi words written in English (Roman/Latin) script to actual words in the Devnagari script.

Here are the steps to follow for Hindi texting.

1. Toggle the button 'a->?' on the English keyboard to turn on/off transliteration mode.
2. In the transliteration mode, you can type a Hindi word using English letters of the alphabet and the app will convert them to Hindi.

Hadoop moves beyond Linux, onto Windows too!

If you thought Hadoop was just confined to Linux, think again! Hortonworks, the creators of the Apache Hadoop Linux distribution,

is now entering Windows territory. Shaun Connolly, vice president of corporate strategy, Hortonworks, said in a report, "This is an enterprise-ready, 100 per cent open source Apache Hadoop platform for the broader Windows environment. We have been spending a lot of time integrating with Microsoft's SQL Server franchise and its business intelligence tools."

Commenting on the move, Herain Oberoi, director of product marketing, Microsoft said, "When we first set out on this partnership about 18 months ago, our joint objective was to make Hadoop available to the broadest set of users possible."

Oberoi further said that with this joint effort, Microsoft did not want to make this a proprietary port. "We're committed to putting our effort back into the community and the Apache Hadoop project," he said.

Two days before the launch of Windows 8, Microsoft had announced its partnership with Hortonworks, which is one of the companies playing a leading role in the open source Apache Hadoop project. In addition, the company unveiled the latest previews of a cloud-based solution and an on-premise solution for deploying and managing Hadoop. The previews showed customers how they could use Excel, PowerPivot for Excel and Power View for business intelligence (BI) and data visualisation, on the data in Hadoop.
