

An open source tool to find the author of any document!

Now authors will never feel lost, even if they wish to because of an open source tool that can determine the author of any document. A team of Adelaide researchers released this tool that compares texts, to judge who the author of a text is.

The documents that the researchers used to develop the software on Github were a series of US essays called The Federalist Papers, and the Letter to the Hebrews in the New Testament. The report states, "The Federalist Paper essays were written in the lead-up to the drafting of the US Constitution, by Alexander Hamilton, James Madison and John Jay. Of the 85 essays, the authorship of 12 is disputed and one has generally been attributed to Jay."

A Linux version for the visually challenged

Now, even the visually challenged can enjoy the benefits that Linux offers. A unique initiative by C-DAC, Mumbai, offers an open source platform to the visually challenged in the country. It is called Accessible Linux for the Visually Challenged (ALVIC).

ALVIC, an all-round desktop platform, is a GNU/Linux distribution that is based on Ubuntu 10.04 and uses the Orca 3.2.0 desktop screen reader that the visually challenged currently work with. The platform comes enabled with features that aid blind users to read, by default.

This product has been released under the project 'Enhancing Accessibility for FOSS Desktops' at C-DAC, Mumbai. It is aimed at developing software-based assistive technology as well as solutions for the differently-abled.

the online music search access music websites in China, adding Chinese calendar support alongside lunar and Gregorian calendars, and making the weather forecast pull its information from the China Meteorological Administration."

Intel releases Android 4.2 with dual-mode Windows 8 option

Intel has been quite late in catching up with the Android iteration. It is only recently that the hardware company decided to introduce the Lexington chipset, which can be used on entry-level phones made by Xolo, Asus and Safaricom.

Apparently, Intel has upped the ante and the latest move by the chip-maker has been to release Android 4.2 (Jelly Bean) developer code that can be used on Intel-based hardware, most notably Windows 8 running systems.

Intel developers at its Open Source Technology Center have been working on the Intel-optimised Android 4.2.2 alpha dev code, which can be used on Windows 8 with the dual-mode option.

The post states that the developer code offers UEFI boot support, as well as support for dual-booting with Microsoft's Windows 8. The dev code is said to be powered by the Linux 3.8 kernel and comes bundled with an interactive installer which will make working easier.

Now plug your Android to boot Linux on a PC

The benefits of Android are growing by leaps and bounds. Those who have used Linux operating systems know that you boot Fedora, Ubuntu or many other distros from a CD, DVD, or flash drive. Now you can add another option to the list, your Android phone.

Using DriveDroid, which is a free app, you can store a Linux ISO on your phone and directly boot that disk image by plugging it to a PC.

With this, you will not have to overwrite Windows or any other OS running on your PC's hard drive and can easily boot into an operating system such as Ubuntu or Chromium OS.

This also gives you the freedom to test the OS before finally installing it and allows you to boot a Linux OS on a PC as a sort of repair utility, wherein you can reformat the hard drive, recover files, or perform other operations if there's something wrong with your primary operating system, the report further stated.

Using DriveDroid, you can also download Linux-based operating systems. The list includes Ubuntu, Fedora, Arch, CrunchBang, Debian and OpenSUSE.

DriveDroid requires a rooted phone or tablet and a USB cable to work properly. Some operating systems and some Android devices may not work as well as others.

No Firefox browser for iOS!

If you are an iOS device user, you should know that Mozilla has refused to offer a dedicated Firefox browser app for iOS. Mozilla has had enough of Apple's attitude towards third party applications and decided to never offer

Firefox browser for iOS, ever!

According to reports, Mozilla has confirmed that its popular Firefox browser will not be available on Apple's iOS.

The company, which is also eyeing the competitive mobile segment with its Firefox OS along with its browser, had decided to remove the Mozilla Firefox Home from Apple's App Store last year. And the company is not currently building a version of the Firefox browser for iOS, nor does it plan to
