

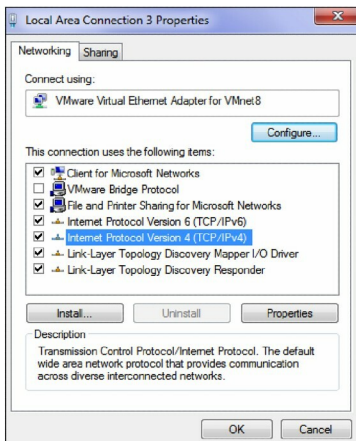

Figure 1: Windows adaptor settings

Figure 2: WinSCP login

```
ssl_sslv2=YES
ssl_sslv3=YES
rsa_cert_file=/etc/vsftpd/vinayak.pem
```

- Start the FTP service with `service vsftpd start` and also start the `sshd` service (`service sshd start`). Do make sure that your firewall settings are appropriate to let other systems connect to your server for file transferring. Now our server-side configuration is complete, and my FTP server is running on 192.168.0.1. But if I try to access the FTP service with a normal FTP client, it gives an error (Figure 4). We need a secure FTP client, so let's

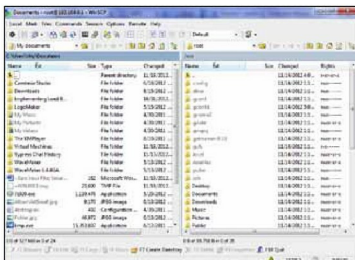

Figure 3: WinSCP screen

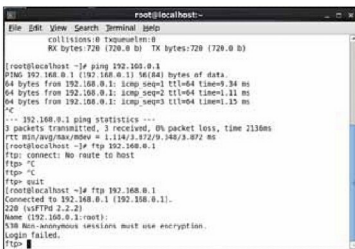

Figure 4: FTP access error

Figure 5: Secure FTP access

use `sftp`, which is installed by the `openssh` package (but first check if you have it installed, or install it with `yum install openssh`). Then access the FTP server with `sftp 192.168.0.1` (Figure 5).

So now you can enjoy secure and easy file transfers. That's all you need for now, and I hope you've found this article useful. So till we meet again, keep exploring the amazing world of FOSS.
