Vyasa PS:

How can I install Linux within Windows XP? I need Linux as a icon on my desktop. Please give the necessary link for supporting software?

Like · comment

Evin Ugur:

Install the free virtualisation program virtual box, and obtain an image of your Linux distro of choice. Mount that image, and open virtual box and tell it to create a virtual machine of said distro. From there you can customize the virtual machine to have an icon on the host machine's desktop/start menu/etc.

Rudra Patra:

Use VMware or Virtualbox.

Mandrita Neogi:

Install VMware. Inside the VM you can install any OS. But it is very slow. However writing commands in the terminal won't be an issue.

Coöl Khan:

Download virtual box and .iso of whichever Linux OS you want install.

Kevin Fitzpatrick:

You can install Linux in windows. You can run it on Windows using QEMU in a few simple steps. See http://damnsmaillinux.org/wiki/frequently_asked_questions.html.

Haresh N Latha:

Use Ubuntu's WUBI app.

Jay Gan:

Oracle virtual box

Utsav Rana:

Install Virtualbox to install Linux, alternatively you can do a full installation of Ubuntu. Get it from www.ubuntu.com. Burn the ISO file onto the disc and boot from it. Ensure that the boot from the DVD option is enabled to boot from disc.

Vyshakh Pv:

Install VirtualBox on Windows, install Linux in VB... Make an icon on desktop. Launch Linux with this icon.

Satyesh Tripathi:

Download VMware and Linux ISO file. Moreover, in Ubuntu you have a WUBI application that installs Linux on Windows but not on desktop..

Mohammad Adil:

Any virtual desktop software should work.

Shyam K Mondal:

In my PC that has Fedora, MySQL is configured as "startup MySQL when system(OS) is startup"...Now I have forgot the command "how to make auto-start?" and "how to disable this feature?" So, please give me command line statement for both.

Suman Goswami:

1. To check only MySQLd server:

```
[root@fedora ~]# chkconfig --list mysqld
mysqld 0:off 1:off 2:off 3:off 4:off 5:off 6:off
```

[root@fedora ~]#

2. To make MySQLd auto start when you boot your computer:

```
[root@fedora ~]# chkconfig --level 35 mysqld on
Note: Run Level 3 = Full multiuser mode with no GUI
```

Run Level 5 = X11 or GUI mode

3. Use the chkconfig again to verify the changes:

```
[root@fedora ~]# chkconfig --list mysqld
mysqld 0:off 1:off 2:off 3:on 4:off 5:on 6:off
```

[root@fedora ~]

Riya Patankar:

Try chkconfig to add MySQL to the start automatically.

Rahul Ghose:

You can use the more user-friendly 'Services' Gnome application or 'BUM' also known as Boot-Up-Manager.

Vinit Shandilya:

How can I make socket connection over the Internet without port forwarding? I'm trying to establish an HTTP connection between a client phone and a server phone using basic socket model. The end points may not reside in the same network. I know GPRS network provides private IP addresses to client phones, so I can't use that IP address to bind to server socket (which is also having a private IP address) unless the ISP provides a mapping of private to public IP address mapping via eDNS (say, www.vinit.com). Is there any work around for this (of course that doesn't involve paying to third party)? Please help!
