**Sushant Shambharkar:** CentOS**Vadiraj Joish:** Centos for sure.

Kevin Fitzpatrick: DSL was updated recently & it's ISO is only 50 M & can run in windows with QEMU & a few simple steps.

TinyCoreLinux.com has a 8-12 M ISO w/ GUI min 496 28 M wiki.laptop.org/go/Tiny_Core_Linux (might run in windows with QEMU)

.alpinelinux.org/downloads 65 M ISO runs from RAM (thus fast, though the above might too).

**Abhishek Verma:** CentOS.**Alejandro Aguado Manchado:** Zentyal is the most easy domain controller based in Linux.

Tshapo Terry Makwela: Ubuntu and then install ClearOS to give out those services.

Nick Jamison: Hey! I have heard that Android has quite a few viruses/malware, while Linux has relatively few. How is this possible as Android is a form of Linux?

Spencer Allen: People root their phones, there's no need to root a Linux desktop. People use untrusted binaries on their phones, and get them from unapproved unmonitored app repositories like 4shared. For the Linux desktop people mostly stick to their distro's app repository.

People still don't think of their phones as computers. They just don't make the connection so they never think to install antivirus or a firewall BTW if you're looking for a good product to do that I recommend avast. No you can run as root in Linux if you want, it's still not advisable though. I think the biggest contributor to malware on android phones is the fact that not all the software available to it is free. Just the fact that you have to pay for it has people looking for cracked versions, anyone who's spent time gathering pirated software knows it's a game of Russian roulette. You compound the issue with carriers getting overzealous with what you can and can't install or can and can't replace on the phone and you end up with people taking unnecessary chances with their phones. If it wasn't for the carrier wanting to force their customers to run crap like AT&T Maps the play store would have a safe and trusted method of loading custom ROMs.

Nick Jamison: Thank you! That makes more sense. I don't run my linux partition in root, but it will look into AV software. Isn't the ability to root a major security flaw present in Linux?
