

“India has immense under-utilised talent in the cloud security space”

Website security is getting increasingly challenging with 'innovative' attacks emerging every day. But, thankfully, as threats increase, so do the security measures. **Diksha P Gupta** from *Open Source For You* spoke to **Ritesh Sarvaiya, CEO, Defencely.com**, to understand the website security scene in India, and the online threats that will affect Indian SMEs and SMBs. Read on..

Q Please share some details about what Defencely does with respect to cloud security?

Modern day attackers can plant a cookie attack, a sniffer, misleading information or anything that can put visitors or customers who visit your website, at risk. So, it becomes extremely important for website managers to be aware of these constantly evolving threats. It is your responsibility to make sure that your security parameters are all up to date, and we at *Defencely.com* can help you to make your website secure, as we have done for global technology giants like Google, Apple, Facebook, PayPal, etc.

Defencely.com currently focuses only on Web applications, penetration testing, and vulnerability reporting and fixing. The first phase of the company's operations commenced just three months back. We are primarily

focusing on Open Web Application Security Project methodology. In fact, we provide the industry's early stage testing services; 80 per cent of our work is in manual 'Search and Report' mode and 20 per cent via the automated tools.

Q How do you see the cloud security space evolving in India?

As far as cloud security in India is concerned, it has immense scope. India has only about five to 10 recognised cloud security companies that deal in all kinds of cloud application testing. Though Indian companies do focus on cloud security services, this sector, so far, has not been organised because of India's cyber laws, which according to me, are not up to the mark. India has ample talent in this domain but it is not utilised so far. We aim to utilise these
