

Q With social media being integrated in the websites, does that increase the challenges of administering website security?

Most of the social media websites spend millions of dollars to keep their security at very high levels, because of which IT guys do not have to worry about anything specific.

Q Why do websites get hacked?

Although there are no specific patterns that hackers follow, there are a few common loopholes that often get exploited.

- a) Zero day vulnerabilities: Regardless of whether you have a blog or own a successful Internet business, how often do you consult with a cloud penetration services company for an assessment of your business's online security? 'Zero day vulnerabilities' are explained as those unattended website details that were ignored during the development of the website. Once the website is launched and running, the owner tends to ignore reallocation of key directory files and many other sub-domain URLs, a practice that could be harmful to the business's integrity.
- b) Exploitation is a hacker's favourite tool: Seeing today's cloud security scenario, you should know that many websites are not actually hacked, but exposed through exploits. If the website is lacking security because of weak iFrame modules, improper implementation of user info security parameters, failure in redirecting users to secure pages, or the implementation of outdated SSL certificates, the attacker simply has to misuse that information – in other words, the process is called exploitation.
- c) Technically incorrect: The third category actually involves brute force hacking. We are talking about password cracking, decryption, fuzzing and sending out information to servers. Such forms of hacking are most severe and highly dangerous for any Web business owner. In all scenarios, your best bet is to consult with a credible security services company to shield you from such unforeseen incidents in the near future.

"If the website is lacking security because of weak iFrame modules, improper implementation of user info security parameters, failure in redirecting users to secure pages, or the implementation of outdated SSL certificates, the attacker simply has to misuse that information—in other words, the process is called exploitation."

S SQL injection is also one of the major threats to a website. Does Defencely offer a specific solution to SQL injection attacks?

Fixing SQL injection is part of the bundled services that we provide at *Defencely.com*. Once we scan the website with our high-end scanners, we immediately come to know where there are higher chances of SQL injection on a client's Web application; and as a remedy, we patch it immediately, to keep the client's website secure from this threat. **END** 

Hiren Shah,
President, Co-Founder

Hiren Shah is an IT veteran and has over eighteen years of experience with multiple entrepreneurial ventures, investment portfolios and growth-oriented companies. He is actively involved with *QualiSpace.com*, a leading domain name registrar and a web hosting company helping various corporates in establishing online presence. He is also involved with *Infraster.com*, a remote IT Infrastructure management company which takes care of IT Infrastructure remotely covering management, migration and monitoring of servers and various other IT start-ups covering reselling of online web services products.

Hiren's core expertise in dealing with web infrastructure and data centres has helped *Defencely* ride the crest of success.

EFY Group's New Initiative

EB TIMES

This 8-page monthly **B2B Newspaper** is a resource for traders, distributors, dealers, and those who head channel business, as it aims to give an impetus to channel sales
