

HP Launches New Servers for SMBs

The company's new ProLiant servers aim to simplify IT and boost business productivity for small and mid-sized businesses in India.

SMBs in India are the biggest market segment for almost all IT service providers, including HP. In a bid to offer cost-effective yet user-friendly IT infrastructure solutions to SMBs across the country, the company has launched HP ProLiant servers that help small and mid-sized businesses (SMBs) accelerate growth by simplifying the deployment, management and maintenance of their IT infrastructure.

The new HP ProLiant MicroServer Generation 8 (Gen8) aims to provide a simplified set-up, management and maintenance with HP Smart Technologies. The HP MicroServer offers centralised, anywhere, anytime data access to employees to boost productivity and collaboration through data sharing. The size of this MicroServer is really worth a mention. It is small and quiet enough to sit on a desk.

Speaking about the product, Vikram K, director, ISS Business Unit, Enterprise Business, HP, said, "SMBs have limited financial and human resources to invest when responding to growing customer demands and evolving business needs. Smaller enterprises, such as retail stores, medical practices and real estate offices need simple, scalable and cost-effective solutions to power their businesses. This new server from HP is good enough for just that purpose."

According to AMI Partners, a global strategy consulting firm, at least 5.1 million small businesses worldwide will purchase their first server within the next five years. The data is based on current buying trends.

According to Vikram, "Small and mid-sized businesses require innovative server solutions that meet their specific business needs and price points to remain competitive. These new HP ProLiant servers are easy to use, highly reliable and cost-effective to maintain, enabling our SMB customers to boost business performance, save time and cut costs."

Although HP works through channel partners to reach out to IT managers, the company is also working on a portal called 'JustrightIT.com' which will be of great help to IT managers, enabling them to choose the right IT infrastructure solutions. Vikram says, "This portal should be launched

in India very soon. IT managers can come on to the portal and just fill in the necessary details to determine what the best IT solutions for their companies are. An IT manager in a company of 500 employees just needs to mention that figure to get all the necessary details regarding appropriate IT solutions, besides being able to get help from our people anywhere across the country, if required."

The new HP ProLiant MicroServer Gen8 claims to deliver the reliability, performance and security of a business server in a 'whisper-quiet' design that is half the size of

most competitive entry-level servers. The company claims it is an 'ideal' first server solution for micro and small businesses, which enables collaboration through centralised information and data sharing. It also enables SMB clients to reduce the time spent on IT so they can focus on managing and growing their business.

Designed for organisations with less than 10 employees, the HP MicroServer Gen8 shares and secures critical information in a central server. It leverages several HP ProLiant Gen8 server innovations as well as the HP ProActive Insight architecture, enabling SMBs to:

- Simplify system installation, the set-up and maintenance with the HP iLO Management Engine (iLO4) and HP Intelligent Provisioning, which are embedded in each server with software and preloaded tools ready to deploy for simplified management.
- Remotely manage the server from anywhere, anytime to increase productivity while lowering operational costs with HP Integrated Lights-Out (iLO) Essentials.
- Continuously monitor performance with HP Active Health, which automatically assesses the servers for optimum health and lowest power consumption, and accelerates application updates to boost server performance and improve uptime via HP Smart Update.
- Deliver an integrated, converged server and networking infrastructure solution with the optional, stackable HP PS1810-8G managed switch, which automatically discovers, monitors and accelerates the connectivity performance of both devices. **END**
