Sasivarnan Ramu: Is there is any open source GSM module? I want to build a mobile phone from scratch and interface it with my computer. What is the cheapest solution for the same (except Arduino)?

Like · comment

Jan Ligudziński: http://openalia.wordpress.com/... - Google is your friend.

Sasivarnan Ramu: Thanks mate, but I need a more cheaper solution than this and without using the Arduino. I have googled a lot but not able to get a solution. Therefore I have asked.

Vinoth Accel: What will be the perfect software that will help one to practice all types of open source operating system-VMware or Virtual Box or any other software?

Like · comment

Usaid Ahmed Mansoori: It must be a Virtual Box. It is a small and an effective tool.

Tejas Ghalsasi: Well Virtual Box, because it's open source..

Nadir Palacios: Vmware.

Joselito Menguito: Virtual Box.

Yogesh Jadhav: Oracle VirtualBox is the best open source application for virtualisation.

Utsav Rana: Virtual Box is a good software to run any OS within the host OS but it does not implement any auto update feature. If a new version comes, you have to download it and install the same but it will not auto update like any other software.

Kripa Shankar: Virtual box as it helps to make screenshots. So whenever we get stuck in Linux, we can simply rewind the whole process.

Ravindu Gunathilake: QEMU is the best, even platform virtualisation has different architectures.

Sid Stăfănescu: Virtual Box is open source, I recommend it.

RS Khandelwal: My PC was dual booted with Windows 8 and Linux Mint. There was a problem. Whenever I used to shut down my PC, after few seconds it used to restart. Then I removed both the OSeS and installed Windows 7 on it but the problem still persists. Can you please help?

ChangYi Lin: It's not a software problem. Try update your BIOS version or clear CMOS settings: especially the Behavior after power loss, change settings from "Resume previous state" to "Power off".

Alexandros Aristotelous: Then it might not be a software issue. Try updating your BIOS and try again.

Paul Warwick: Until you get it sorted, switch off the power after shutdown.

Mahesh Watkar: Check the system logs for any hardware issue.

Utsav Rana: I guess you have tried shutting down from Windows 8. Try shutting down from Linux and see what happens. Install the latest updates to both the systems accordingly.

Jacob B Stevens: Could be auto updates from Windows, running in the back round. Rebooting once installed and shutting down may help.

Stephen Lunak: Leave Windows and just use Mint. This will help.

Yogesh Jadhav: It clearly indicates BIOS problem. Check the BIOS setting or use default BIOS setting.

Arun Jain: Check your system's hardware also.

Farhan Ahmed: If you remove the check from "automatically restart" under "System Failure", you might see an error message the next time you face this problem. Just write that error message here. This seems like a hardware issue, just check what error message he gets, if he has Windows 7, then go to Computer icon.

Joshua Benz: So at one point, both Windows 8 and Linux Mint worked or did only one work? Assuming both worked, it is possible that for whatever reason, Windows crashes when you try to shut it down. However this can only be the case when you shut down in Windows.
