

recognised and well established. On the other hand, Xolo is known for bringing out something absolutely new and innovative. We were the first ones to get an Intel phone into the country. For us, this is part of the natural progression. This time we wanted to bring out something that is innovative and provided the desired speed to users. Tegra 4 meets all these criteria. It is fast, absolutely awesome for gamers and comes with quite a few innovative features. Hence, we chose the Tegra 4 platform for this device. Tegra Note will offer a great gaming experience. It will also be a device for photography freaks as the camera it carries comes with continuous HDR. This will enable people to click better pictures. Generally, when we click images, there are two zones—the high light intensity zone and a very dark zone. Usually cameras tend to focus either on a very low intensity zone, where the light gets absorbed and the entire image gets too light; or if the focus is on a dark zone, then the image gets too dark and you cannot see at all. What this technology does is take images at different exposures, which enables the darkness and the brightness to be captured appropriately. So when you have continuous HDR, it helps you create good images in extreme conditions of bright or dark light.

Q Lava is currently investing a lot in the Xolo series. What about the other Lava products and where do they stand in the company's scheme of things?

It is not like Lava is only investing in Xolo. Lava as a company continues to invest in R&D linked to various products. You can see that with Lava's Pro series. Having said that, I will not disagree that Xolo has become a priority in the sense that it is a series with technologically advanced features. So, the investment in this series is a bit higher as compared to the other products. Before Tegra 4, we had partnered with Intel and Tegra 3. Xolo is one series that continues to advance technologically, pretty rapidly. On the other hand, Lava's other products will consolidate their positions in the market and move into fairly advanced areas, but at a slightly slower pace. So to answer your question, Lava's broader product range is definitely not being ignored, but Xolo continues to attract more of our attention. There are also plans to launch Xolo as an LTE-based phone soon.

Q What is this LTE phone all about? A lot is being done with respect to LTE enabled devices, but there is hardly any LTE in India.

LTE is already available and it is poised to become a mass market concept very soon, across the

country. Various service providers are rolling out their respective services in this domain and I see LTE becoming a common phenomenon in a year and a half. It is already available in some cities like Chandigarh, Kolkata and Bengaluru. With LTE-enabled phones, people who are connected to a compatible network can start experiencing it on their devices. The benefits of LTE are such that one cannot remain untouched by it.

"We wanted to bring out something that is innovative and provided the desired speed to users. Tegra 4 meets all these criteria. It is fast, absolutely awesome for gamers and comes with quite a few innovative features. Hence, we chose the Tegra 4 platform for this device. Tegra Note will offer a great gaming experience. It will also be a device for photography freaks as the camera it carries comes with continuous HDR."

Q Is Lava engaging with developers for the Tegra 4 based Tegra Note?

Well, Tegra 4 is too new a platform and a fairly expensive one. It will take some time to build an eco-system around it. Having said that, I want to mention the initiatives that Lava has undertaken for open source software developers. We are the only Indian OEM offering rooting support to most of our devices, officially. Users can actually root their Lava devices and get control of them.

Q Is there a reason for choosing Android as the preferred platform for your devices?

Yes, Android is undoubtedly the most popular operating system. One of the reasons for its popularity is the eco-system it comes with. Users get apps for almost everything on Android. Also, it is easy to use and has become the norm in the smart phones business.
