

LibreOffice software quality improved

The results for the Coverity Scan Project Spotlight have been announced by the company. The project analysed LibreOffice for the types of defects and the defect density in the project to compare it with the industry average. The project was taken care of by Coverity Inc, a company involved in development testing. LibreOffice is a Document Foundation project and is the open source counterpart to Microsoft's MS Office. The program first started with evaluating the OpenOffice suite in 2010.

LibreOffice was linked to the Coverity Scan service in October 2012 and has employed the service to scan through over nine million lines of code. This has helped the project identify more than 4,700 critical defects, which include over 2,100 high risk and medium risk defects, which have been corrected. The company's defect density has reportedly gone down from 1.11 to 0.84.

In a report, Jennifer Johnson, chief marketing officer for Coverity, said, "With open source software reaching mainstream adoption in commercial software development projects, development testing has become a core part of the open source development process to find and fix critical software defects early. Our Coverity Scan service is experiencing explosive growth within the open source community, and we applaud LibreOffice, along with all of the open source projects that use our free service, for their commitment to creating and delivering high-quality software."

required to click on the update button in WordPress or download the new version of the software in order to fix security glitches. Now, though, the background updater provides the option of automatically updating the system. The implications of this are quite obvious. While earlier, websites were at risk of inadvertently running older versions of WordPress, now there is no such worry.

Android KitKat comes with new photo editor

Amongst the many new features in Google's new Android KitKat operating system is a new photo editor. The lesser known updated photo editor is reportedly quite ahead of earlier versions. The new version allows you to add filters and

effects to your pictures, while also allowing you to make adjustments for single colours in the photos that you take from KitKat-based devices. Currently, the Android 4.4 OS is only on the newly launched Google Nexus 5, but many OEMs have promised upgrades soon.

Not only is the new photo editor more advanced, it is also amongst the easiest currently available on smartphones. Further, the editor can be used directly from the smartphone's photo gallery. This means that you do not need to make any new downloads and neither do you have to keep updating an extra application.

The photo editor will come as a part of Android updates. This means that when your current smartphone gets updated to the new KitKat version of Google's Android OS, it will automatically get the photo editor too.

Samsung to bring out foldable smartphones next year

Samsung has revealed quite a few plans for the future at its first analysts' day in the last eight years. The company revealed that it was aiming to bring out foldable smartphones by 2015. Now, sources say that smartphones coming from Samsung in 2014 will have

double the pixels that current smartphones have. The company also promised AMOLED display panels with 560 ppi density for its future phones, said the report. Samsung reportedly directed analysts to look forward to 4K resolutions in 2015.

Further, Samsung revealed that it has shipped over 100 million units of the Galaxy S and Note handsets in 2013. The company also put in a forecast about wearable and flexible devices being the next big category. Samsung's Galaxy Gear smartwatch is the company's first foray into the wearable devices market.

Samsung may launch massive 33.78 cm (13.3-inch) tablet in 2014

Samsung could launch a 33.7-cm (13.3-inch) tablet in 2014, reports say. According to Korea's ET News, the 33.7-cm (13.3-inch) tablet is not the only mega-sized tablet that the South Korean giant is working on. The bigger tablet is also rumoured to be the first dual-boot device from Samsung, which will sport both the Android and the Windows RT operating systems.

According to ET News' sources, Samsung is planning to make huge inroads into the tablet market through this new gargantuan tablet. The South Korean manufacturer reportedly has plans to ship 40 to 42 million tablets in 2014. Not
