

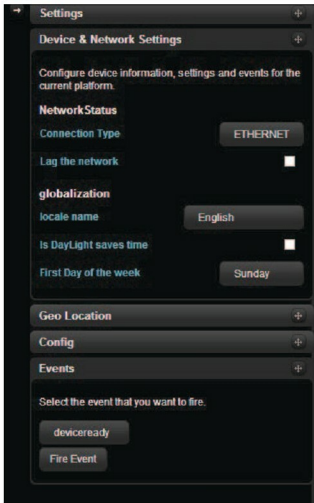

Figure 7: Device and network settings and PhoneGap events in Ripple

The next tool is an extension of Google Chrome called the Ripple Emulator. It is indeed a very handy tool and much more diverse than the one discussed above. You need to first install it from the Chrome Web Store. Once installed, you can open up any site, and at the top right of the Chrome browser, you can find the Ripple Control Panel, which can be used to enable or disable Ripple Emulator for that particular website. Ripple is very robust, given the fact that it runs on your browser. To begin with, Ripple has support for Cordova/PhoneGap too. When you enable Ripple for the first time for any website, you will be asked which platform/runtime you wish to use to test (Figure 5). It has support for multiple platforms as already seen. It also supports various devices along with orientation settings too. More than that, to help developers in case of any discrepancies, it also provides information about the screen size, user agent, platform, pixel density, etc. One can even emulate an accelerometer and geolocator. All this is shown in Figure 6. If you're using PhoneGap/Cordova, it even lets you adjust the device and network settings. (Figure 7). Ripple is a very handy tool if you do not have an actual device in hand. More than that, its support for PhoneGap really helps hybrid mobile app developers and increases the scope for testing mobile Web apps.
