

An office on the go

Generally, every smartphone comes bundled with apps such as Adobe Reader and OfficeSuite for reading PDF files and Word documents. But sometimes, you may want apps that give you more than just the basics. You may want just one app, which reads all kinds of files. *Quickoffice* is one such app available on Google's Play store, which allows you to create and edit Microsoft files such as Word documents, Excel sheets and PowerPoint presentations. Additionally, this app lets you read PDF files, and lets you upload these files on Google Drive directly through the app. If you need an app with gesture features, like the Dolphin browser, you could have a look at *Kingsoft Office*, which boasts of this feature. *Olive Office* also lets you create and edit all these documents. This app even lets you edit and apply formulae in every single cell of an Excel sheet. And it lets you save your file in the latest versions of Microsoft file extensions. For instance, you can save a Word file either as *abc.doc* or as *abc.docx*. So if your colleague sends you a (.docx) via e-mail, Olive Office lets you open these files without any hassles.

OpenOffice and LibreOffice use only the *ODF* format and *OpenDocument Reader* is one of the few apps that actually lets you view files with an *ODF* extension. It is a simple-looking app that lets you read and edit files in a lucid manner, no matter where you are.

When you think of PDFs, the first name that comes to mind is Adobe. Fortunately for us, Adobe has also released a version of its famous PDF reader for Android devices. You can quickly open files, easily zoom in or out, use the search function to find a particular word or slab of text, add comments, fill out forms, print and share documents and do a lot more.

What's more, this app is absolutely free! Besides Adobe Reader, there are numerous free and paid apps available for reading PDF files such as *PDF Reader*. Another interesting and useful app is called *PDF Scanner*. The highlight of this app is that it lets you scan photographed documents and instantly convert them into PDF documents.

An extension to your memory

As a part of our daily lives, whether at the office or at home, we always have multiple different tasks to do. It would be nice if we could have that long list of what needs to be done, handy. It would also be great to be reminded of the tasks to be done at that specific day and time. Fortunately for us, there are a number of apps available on the Play store, which have a variety of features; so choose the one among them that suits you best. One such app is known as *Wunderlist*, and just like its name, it truly is a wonderful app! It has a number of features that let you categorise tasks as per your preference and priority. Additionally, it lets you do a host of other things like adding sub-tasks under a task, writing notes within the task, attaching files and adding a reminder. It even lets you categorise tasks under different labels like work, private, tasks to be done within the week, etc. Further, you can make

your own list and add tasks into it. The flexibility of this app does not end here; it lets you share a particular list with other people. So whether it is a list of groceries that you want to ask your husband to shop for or a list of things to do in the office, you can share these tasks with anyone.

Any.do: The to-do list and task list are other extremely popular apps. *Any.do*, besides the smooth interface and seamless functioning, has some very unique features like syncing all your tasks with the cloud (Dropbox or Google Drive), and turning missed calls into reminders; and you just have to shake your phone if your task is completed. Besides, this app gives you total freedom in changing the appearance and themes of the interface. Creators of this app obviously believe that typing is passé, so all you have to do is talk to the app and it stores a task for you.

GTasks, To-Do List, Task List and Do it (Tomorrow): These are some of the other popular apps used to create lists. Additionally, there are other apps such as *Tasks*, *Tasks N Todos*, *To-Do List Widget* and *List Master*, all of which have their own unique features. Most of these apps are integrated with note-taking functions. However, if you want to take only notes, there are some excellent apps available for Android. *Evernote* and *Google Keep* are two of the most popular note-taking apps. *Evernote* is an extremely extensive app. Not only does it let you perform the basic task of keeping notes, but you can create multiple notebooks and share them with as many people as you want. It lets you sync the notebook with other devices and attach pictures, documents, audio clips and videos to a note.

"A picture is worth a thousand words!" It is not the first time we have heard this phrase and it won't be the last. So wouldn't it be just simpler to *show* than *instruct*? With apps like *Skitch*, you can highlight a particular area in a snapshot and share it with others directly from the app via email or on Facebook. An awesome feature of *Skitch* is that it is in sync
