Ubuntu 14.04 will mark first appearance of Mir Server

Canonical will reportedly offer the new display server Mir along with the Ubuntu 14.04 operating system slated for release in 2014. According to reports, the next iteration of the Ubuntu OS is going to be very different from other Linux distros. Canonical had announced the Mir project back in March and the Ubuntu 14.04 Linux-based distribution is slated to be released in April 2014.

For the uninitiated, the Mir project has nothing to do with the Sputnik laptops by Dell, except that both are named after Soviet spacecrafts. With this project, Canonical plans to start a new display server that will become a mainstay in open source operating systems. A display server refers to the part of the OS that is responsible for drawing pictures on your computer's screen. If the project is completed in time, the current X server will be replaced by Mir.
