

can be solved easily. For each Web browser/rendering-engine, you give additional *animation*: line and *@keyframes* rule with a suitable prefix. The prefix is *-moz-* for Mozilla Firefox, *-webkit-* for Webkit-based browsers such as Chrome, Chromium and Apple Safari, and *-o-* for Opera. Let us look at the change more closely:

```
<style>
  .style_anim
  {
    animation: anim_kf 5s;
    -moz-animation: anim_kf 5s;
    -webkit-animation: anim_kf 5s;
    -o-animation: anim_kf 5s;
  }

  @keyframes anim_kf
  {
    from {color:black;}
    to {color:green;}
  }

  @-moz-keyframes anim_kf
  {
    from {color:black;}
    to {color:green;}
  }

  @-webkit-keyframes anim_kf
  {
    from {color:black;}
    to {color:green;}
  }

  @-o-keyframes anim_kf
  {
    from {color:black;}
    to {color:green;}
  }
</style>
```

This is just a copy-paste job. Once everybody has the latest browsers, we can collapse to the standard elements, forgetting these prefixes.

Method 2: Defining many keyframes

The above example had only two keyframes—initial and final. To include more than two keywords, we can use the percentage of completion:

```
@keyframes NAME
{
  0% {STYLE_0}
```

```
25% {STYLE_25}
...
100% {STYLE_100}
}
```

An animation is the gradual change from 0 per cent to 100 per cent. So our first example with *from-to* can be rewritten as follows:

```
@keyframes anim_kf
{
  0% {color:black;}
  100% {color:green;}
}
```

Including more keyframes, we can write as follows:

```
@keyframes anim_kf
{
  0% {color:black;}
  25% {color:red;}
  50% {color:green;}
  75% {color:blue;}
  100% {color:#ff00ff;}
}
```

More tips

Now let us learn some customisations tips. To achieve customisation, we must include *CSS3 Animation Properties*.

To make the animation play forever, apply the property *infinite*. It is attached to the *animation*: line, like the playback duration.

To set some delay before the animation, use *animation-delay*. To set the number of times the animation is repeated, use *animation-iteration-count*.

Here is an example code:

```
.style_anim
{
  animation: anim_kf 5s infinite;
  animation-delay: 3s;
}
```

Combining CSS3 with JavaScript

Combining CSS3 animations with JavaScript is very simple. For example, we add a *Reverse* button to the HTML body as we did in our video playback example:

```
<body>
  <h1 class="style_anim" id="h1_hello">Hello</h1>
  <button onclick="play_reverse()">Reverse</button>
</body>
```

Also note that we have given an ID to the *h1* element *Hello* and the animation is made infinite by giving *infinite* at the end
