

of *animation*: line. Check the script below:

```
<script>
function play_reverse()
{
    hello = document.getElementById("hi_hello");
    hello.style.animationDirection="reverse";
}
</script>
```

Press the button while the animation plays forward. It runs backward!

Interactive pages

A vast range of new elements is defined in HTML5, which helps us to create interactive forms, replacing Flash.

Some of the new *input type form elements* are:

- colour
- date
- email
- time
- url

As a basic step towards *web application developing*, let us create a small interactive page. It simply plays a CSS3 animation, but the user can enter some parameters. The code is self-explanatory, so let us jump into it directly:

```
<!DOCTYPE HTML>
<html>
<head>
<meta charset="utf-8"/>
<title>CSS3 Animation</title>

<script>
function change_color()
{
    hello = document.getElementById("hello");
    inColor = document.getElementById("inColor");
    hello.style.color = inColor.value;
}
</script>

<style>
.style_anim
{
    font-size: 26pt;
    animation: anim_kf 5s infinite;
}

@keyframes anim_kf
{
    from {transform:rotate(0deg);}
    to {transform:rotate(360deg);}
}
</style>
```

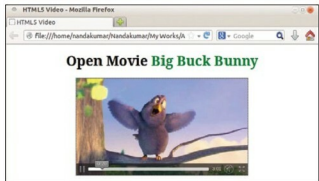

Figure 1: Open movie 'Big Buck Bunny' being played in Mozilla Firefox using HTML5 video technique

```
</style>
</head>

<body>
<table height="250px"><tr><td>
<div class="style_anim" id="hello">Hello</div>
</td></tr></table>
<input type="color" id="inColor" onchange="change_
color()">
</body>
</html>
```

Note: Don't forget to make the animations universal by duplicating them with prefixes like *-moz-* and *-webkit-*, as we have done in an earlier example.

Just escape from Flash!

In three parts, we have discussed 'HTML5 media playback', 'CSS3 animations' and 'interactive page designing'. These are, of course, very basic, but are a good introduction to HTML5 and CSS3. By running your own experiments and searching the Web, you will be able to master this simple but powerful and standard technology. Yes, it is time to escape from the outdated Flash!
