

Figure 1: First screen of the app

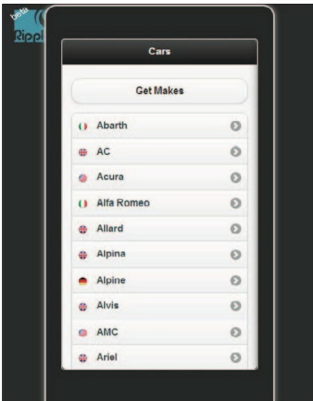

Figure 2: ListView populated with car maker names

In the first click event - `fetchCarMakes` - we first show the jQuery Mobile loader using `$.mobile.loading("show")`. We then make a 'GET' call to fetch all the car makers from across the world. When we receive the JSON response, we parse it accordingly and push it into the `listViewData` array. Once the array is completely populated, the `ul` on the view will automatically get updated. But to update the jQuery Mobile `listview`, we need to explicitly call `$("#dataListview").listview("refresh")` on the `listview`.

Similarly, for the `li` click event—`fetchModels`—we pass the car maker argument into the function and use it to make the appropriate 'GET' call. And, just as above, when we receive the JSON response, we parse it accordingly and push

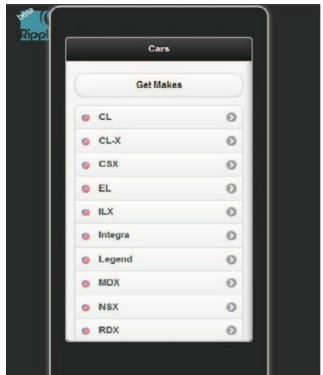

Figure 3: ListView refreshed with car model names for a particular car make

into the `listViewData` array. As a result, the same `ul` on the view gets updated automatically.

We can first test this locally using the Ripple emulator on Google Chrome. When the initial screen is run, we can see in Figure 1 that only the header and the 'Get Makes' button is shown. When we click on the button, we see the jQuery Mobile loader, and then automatically, `listview` appears with the car makers' names and their country flags, as seen in Figure 2. This list is very long and is scrollable, automatically. Next, when we click on any particular car maker, the loader appears again, and the `listview` is updated with the car models as seen in Figure 3.

So now when things are working properly, we can package everything to run it on a device. All we need to do is to zip the entire folder and open www.build.phonegap.com. We can upload the zip file there, and get the respective installation files for various platforms.

The codebase can be found at <https://github.com/kazekagegaara/AngularJSCarApp>. You can get the entire codebase, put it into a zip file, build it as instructed above and use the app on your own devices. **END**
