

Figure 7: Deploy Application to GAE from Eclipse

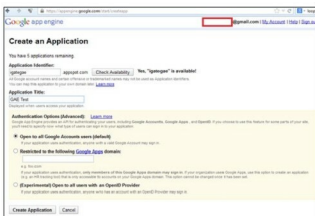

Figure 8: Create Application Identifier for GAE Application

```
<appengine-web-app xmlns="http://appengine.google.com/ns/1.0">
  <application><application>
  </application>
  <version>1</version>

  <!--

  Allows App Engine to send multiple requests to one
  instance in parallel:

  -->
  <threadsafe>true</threadsafe>

  <!-- Configure java.util.logging -->
  <system-properties>
    <property name="java.util.logging.config.file" value="WEB-INF/logging.properties"/>
  </system-properties>

  <!--
```

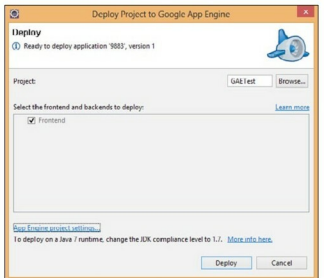

Figure 10: Deploy Project to GAE

HTTP Sessions are disabled by default. To enable HTTP sessions specify:

```
<sessions-enabled>true</sessions-enabled>
```

It's possible to reduce request latency by configuring your application to asynchronously write HTTP session data to the datastore:

```
<async-session-persistence enabled="true" />
```

With this feature enabled, there is a very small chance your app will see stale session data. For details, see http://code.google.com/appengine/docs/java/config/appconfig.html#Enabling_Sessions
