

Figure 6: Firewall configuration

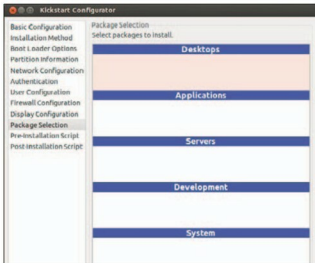

Figure 7: Package selection

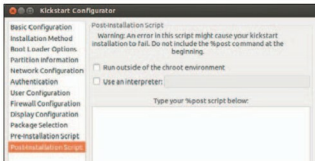

Figure 8: Post-install configuration

steps to be followed to install the Ubuntu OS using the Kickstart configuration file.

Step 1: Download the ISO image from the Ubuntu website and mount the ISO image, as follows:

```
sudo mkdir -p /mnt/iso
sudo mount -o loop ubuntu.iso /mnt/iso
```

Step 2: Create a new directory and copy all the files from /mnt/iso to that, as shown below:

```
sudo mkdir -p /opt/ubuntuiso
```

```
sudo cp -r /mnt/iso /opt/ubuntuiso
```

Step 3: Language selection to prevent pop-ups:

```
sudo cd /opt/ubuntuiso
sudo echo en >isolinux/lang
```

Step 4: Install and configure the Kickstart GUI as described above:

```
sudo apt-get install system-config-kickstart
system-config-kickstart&
```

Step 5: Edit `isolinux/txt.cfg` file to set the boot command line to use the Kickstart and Preseed files. Search for the following:

```
label install
menu label ^Install Ubuntu Server
kernel /install/vmlinuz
append file=/cdrom/preseed/ubuntu-server.seedvga=788 initrd=/install/initrd.gz quiet-
```

Then add `ks=cdrom:/ks.cfg` and `preseed=file=/cdrom/ks.preseed` to the appended line. You can remove the `quiet` and `vga=788` words. It should look like what's shown below:

```
append file=/cdrom/preseed/ubuntu-server.seedinitrd=/install/initrd.gz ks=cdrom:/ks.cfg preseed=file=/cdrom/ks.preseed-
```

Step 6: Create a new ISO:

```
sudo mkisofs -D -R -V "ATTENDLESS_UBUNTU" -cache-inodes -J -l -b isolinux/isolinux.bin -c isolinux/boot.cat -no-emul-boot -boot-load-size 4 -boot-info-table -o /opt/autinstall.iso /opt/ubuntuiso
```

Once you complete all the above steps, you can install and boot using the newly created ISO for Kickstart and find a solution for unattended installations.  **END**
