Aravind Samy:

I am a mechanical engineering student. Which OS is useful for me? Currently I am using Windows 8. I like Linux but I need to install CAD and designing softwares. Any suggestions?

Like · comment

Tareque Hasan: Fedora 19 is waiting for you. It supports 3D printers too. There is lot of designing software available from open source, you just need to give a try and become used to with that.

Surja Gain: Stick to Windows 7 to use Solidworks or Inventor.

Nandan Kulkarni: Stick with Windows. I know Linux looks flashy but it's not for everyone.. give it some more time, at least until the CAD packages start rolling out with full support for Linux. Linux is really powerful but at a core level and when you know what you're doing. Windows is also not bad.

Rahul Krishnan R A: Ubuntu for beginners.

Mahyuddin Husairi: Ubuntu + freeCAD

Nakul Agarwal: Go for virtual Windows. You can install as many OS you want in it.

Thomas Sebastian: Debian Wheezy i.e Debian7 is good option. All Linux softwares can be installed from Synaptic Package Manager. Check the site for cad equivalent -> http://www.tech-edv.co.at/05_Linux/80_CAD-2f3d/10_CAD-20links/index.php

Utsav Rana: You can install Ubuntu along with Windows 8 but the new operating system bios must be cracked before installing Ubuntu. Check out the instruction of bios or go for a Google search.

7chip.com: Stay with Windows 8, if you have any problem with Windows 8 (start menu problem - Install 3rd party start menu). Most of the engineering softwares are not available on Linux (Alternate software available, but not good and useful).

Jomutech Agencies: Windows 7 & 8 should be okay. Move to Linux when necessary & when you can realise the value you are getting.

Aravind Samy: Thank you friends.

Jaskirat Singh Sodhi: Use Wine for Ubuntu, it's a program to run almost all Windows application on Linux, Mac, Paul etc.

Sandeep Thaker:

For a programmer, which OS is good to use? Fedora 18 or Ubuntu 12.10?

Like · comment

Arijit Upadhyaya: Fedora!

Rahul Binjve: Really not much of a difference. I prefer Ubuntu over Fedora due to ease of use and apt package manager. So, totally depends upon you which of the above you're comfortable with. If you're new to both, go for Ubuntu or Mint.

Aditya Singh: Ubuntu 12.10.

Cool Bhushan: It totally depends on needs, still nowadays Ubuntu has a good community than Fedora, so you find more people who faced similar problems and solutions to a problem.

Vaibhav Singh: If you want to work on a kernel level, then Fedora is the best option because its kernel is stable as compared to Ubuntu. And if you want to work on application development, then Ubuntu is better. So it depends on your requirement.

Sayantan Khan: Fedora, because it has most of the programs that a programmer needs installed out of the box, whereas in Ubuntu you'd have to install them manually.

Luis Isasi: Anyone, if you're a great programmer no matter what os you use, it's just a tool, you're the one who makes the difference.

Itsolution Muntazer: Fedora is best for testing purpose.

Matthew George Ford: Depends on the user, if you are new to Linux, then Ubuntu, if you know what you're doing, then fedora, advanced, then linux.

Shajan Jacob: No matter where you program. What is code, only matters!

Abhineet Krishna: Ubuntu.. because your programming stuff would work pretty much the same on both. but installing and managing softwares etc is far better and easier in Ubuntu.

Kinchan Prajapati: Fedora is the best because it's simple to work and since you are a hacker, Fedora is a good option.
