

Mageia 3 Linux distro launched

The developers of Mageia have released the third version of their Linux distribution, Mageia 3. Mageia was forked from Mandriva almost two-and-a-half years ago and according to its developers, this version is all grown up. Well, finally, Mageia 3 can be downloaded for desktops and servers.

More than 100 people from across the globe contributed in making Mageia 3 a reality. The list of features for this Linux distribution include kernel 3.8, GRUB as the default bootloader, systemd 195, KDE 4.10.2, GNOME 3.6, Xfce 4.10, Libreoffice 4.0.3, and updates to RPM 4.11 and urpmi.

However, what stands out in this long list of features is Steam for Linux, which is now available in the repositories.

Those interested can download Mageia 3 for free from the official site.

Snowlinux 4 'Frosty' Linux OS version released

The developers of Debian-based Snowlinux have released their latest Linux distribution. This is Snowlinux 4 'Frosty' and is based on Ubuntu 13.04, which comes with the MATE and Cinnamon desktop themes.

The latest release of the distro gets Cinnamon 1.8, which was introduced earlier this month with the release of Linux Mint 15 'Olivia', which is dubbed as the most ambitious release till date. The desktop theme offers features such as a new screen locking application and a redesigned control centre. The other desktop theme on offer is MATE (version 1.6).

Snowlinux 4 has some new features of its own, a new theme called 'Snowlinux Metal' and it comes with Firefox 21. Snowlinux 4 'Frosty' is available for download from the project's servers and comes in ISO images for 32- and 64-bit systems.

The world's most dangerous virus for Android

At a time when giants like Google are spending millions of dollars in research to protect devices from malware, researchers have stumbled upon the world's most sophisticated malware affecting Android devices.

The recently-discovered malware takes advantage of hitherto unknown weaknesses in the Android platform, by borrowing advanced functions that are closer to a malicious application plaguing a Windows device, making it the world's most malicious Trojan for the Android platform.

The malware has been named Backdoor, and hasn't managed to affect the Android ecosystem too badly, as yet. As opposed to the more benign Android malware, the surreptitious Obad.a utilises Android bugs that were previously unknown. It can be transmitted through Bluetooth and Wi-Fi connections, allowing hackers to issue malicious commands through standard SMS text messages.

Linus Torvalds not happy with latest Linux kernel

Linus Torvalds has yet again stated his opinion about the latest Linux kernel 3.10 and, apparently, he is not happy with the latest release candidate for the Linux kernel.

Speaking to the community via his blog post, Torvalds said that he wished "...things were getting better for the kernel but he would just be lying." This statement clearly reflects his disappointment at the latest release candidate.

He is worried that Linux is becoming too big, which does not bode well for free downloading and use. The latest Release Candidate 5 (RC5) is much bigger in size than the RC4, mostly due to the addition of more lines. Torvalds went to the extent of warning the developers about dealing with the problem in terms of their coding. He wrote, "I'm going to have to start cursing again unless you stop sending me non-critical stuff," adding, "So the next pull request I get that has 'cleanups' or just pointless churn, I'm going to call you guys out on."

Firefox 25 to have a complete design overhaul

A revamped Firefox awaits you! Come October and Mozilla will be releasing a totally revamped Firefox 25 browser. Like always, the company has openly shared its plans regarding the new release.

This is despite the fact that Firefox 22 is in the Beta channel, Firefox 23 is in the Aurora channel, and Firefox 24 is in the Nightly channel. Mozilla has assigned a special Nightly UX channel for Firefox 25, reports The Next Web.

The tabs and the Firefox menu will undergo a complete makeover. As per the images shared, Menu has been moved from the left to the right and can supposedly be accessed from a button that appears pretty similar to Google Chrome's hot dog icon.
