

Among the more advanced features of the malware is its capability to be remotely controlled by SMS messages. It can be instructed remotely by hackers to connect to new command and control servers, where infected phones upload sensitive user data and receive app updates.

A new distro that can run on Raspberry Pi!

The best part about open source and Linux is that it can be tweaked. The latest news is that folks at Fedora have added a twist to their Linux operating system and created an all new distro for the low cost minicomputer, Raspberry Pi.

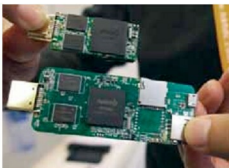

Known as Pidora 18, the operating system is definitely not the first one of its kind. The developers have already released two versions in the past; however, they were not optimised for the ARMv6 architecture. This is what makes Pidora 18 stand apart from the crowd. It is ready for Raspberry Pi.

The Fedora team has used the word 'remix' to describe its new operating system because it includes 'proprietary software provided by the Raspberry Pi Foundation and the SOC vendor Broadcom, which cannot be included directly in Fedora.'

Here comes the smallest Android stick

SmartCandy is the latest Android TV stick that looks like a USB drive in terms of size and weight but is a mini-PC in terms of functionality.

SmartCandy was spotted at a recent trade show. In terms of the hardware, the stick packs a 1.6 GHz ARM processor coupled with 1 GB RAM. It runs Android 4.1 (Jelly Bean). The stick also has a microSD slot.

However, unlike other USB sticks, SmartCandy does not offer in-built Wi-Fi or a USB port but the company provides an external adapter for Wi-Fi and USB. The stick also comes with an option for a dock with Ethernet and three USB ports. Pricing details have not been mentioned but it is assumed it would be priced under \$100, like all the other sticks.

Other than the above mentioned device, the company also has a model that packs a Telechips processor with 512 MB RAM, and 4 GB of storage.

Bill Gates invests in open source!

Bill Gates may be the creator of Windows, the well-known proprietary operating system, but it seems even he is warming to the world of open source. According to reports, Gates has invested in a start-up called ResearchGate, which is a social network for scientists.

Gates is part of a group that includes Tenaya Capital, Dragoneer Investment Group and Thrive Capital, among others, which has raised \$35 million in Series C financing with a mission to make scientific research more transparent.

ResearchGate, founded in 2008, is a social network for scientists, where they can post information about their work and findings via their profile page. This site has been often used by scientists to form alliances with others for research, which is not as easy as it sounds, Ijad Madisch, co-founder and CEO of ResearchGate, was quoted saying.

When you want to perform at the highest level you need to **empower** yourself through **professional** who mastered that level.
