

Figure 1: MAMP/WAMP

Figure 2: phpMyAdmin SQL

```
mysql -u root -p
```

Enter the MySQL root password and then the following commands, one by one, to create a database. Next, create a new user to access this database. As with anything for the root user, you should never use it for daily/normal usage.

```
CREATE DATABASE ownCloud;
GRANT ALL ON ownCloud.* TO 'myclouser'@'localhost'
IDENTIFIED BY 'secure_password';
```

In this case, the user ID of the new user is 'myclouser' and the password is 'secure_password'. You can replace them both with your own choice of a user ID and a more secure password.

Mac OSX/Windows

Open up your browser and navigate to localhost:8888/MAMP on a Mac and click on the tab that says phpMyAdmin. On Windows, click on the WAMP icon in your taskbar and then on phpMyAdmin. Within phpMyAdmin, navigate to the SQL tab. Paste the *Create Database* and *Grant All* commands in the textbox you see on the page and press 'Go'.

That's it! Now, we are all set to begin with the ownCloud installation!

Installing the ownCloud server

Download the latest version of ownCloud from the website. Extract the archive (Windows users can use a free utility called 7-zip to extract it) to a location of your choice. Now, move the ownCloud server files to the Apache directory.

On Linux (Ubuntu)

Run the following command to move the 'ownCloud' folder:

Figure 3: Set up ownCloud

```
cd location_of_extracted_file's_
parent_directory
sudo mv ownCloud /var/www
```

On Mac OSX

Copy the extracted ownCloud folder. Go to the Applications folder on your Mac. Open up the MAMP directory and inside it, go to the folder called 'htdocs'. Paste the folder here. Run MAMP through the *Launchpad* or by searching for it in *Spotlight*.

On Windows

Copy the extracted ownCloud folder. Go to the directory in which you installed WAMP (the default is c:\wamp) and open up the 'www' folder. Paste the folder

here and launch WAMP by clicking on the software icon/shortcut on your desktop.

Open up the browser and navigate to <http://localhost/ownCloud> (Linux/Windows) or <http://localhost:8888/ownCloud> (Mac OSX). Enter the details of your admin account and click on *Advanced* to enter your database access details and change the location in which you would like the synced data to be stored. Enter *ownCloud* as the database name, and for the username and password, enter the MySQL user you created earlier. Click *Finish setup* to complete the ownCloud server set-up process.

Using *ipconfig* on the Windows command line (press *windows+R*, type in *cmd* and press *Enter* to fire up the command line editor) and *ifconfig* on the Linux/Mac OSX terminal, find out your server's IP address. I would strongly recommend you give your server a static IP address. There are many ways to do this, but the simplest would be to go to your operating system's network settings.

Install the ownCloud client

On the ownCloud website, click on the *Install* button on the top bar. Select the desktop/mobile OS you would like a client for and download it. In the server address, use the following commands:

(For Linux/Windows)

```
192.168.0.101/ownCloud
```

(For Mac OSX)

```
192.168.0.101:8888/ownCloud
```

...where 192.168.0.101 is a sample server IP. Input the username and password you created in the last step of the server set-up process and you should be all set! Remember
