to deselect *Use secure connection*.

ownCloud typically creates an *ownCloud* folder in your user directory like Dropbox but you can right-click on the *ownCloud* taskbar icon to add more servers if you wish to. The set-up process is fairly similar on mobile devices. You can add folders and sync your device's videos/pictures from the mobile apps. You can also set up the calendar and sync the contacts on your devices using CalDAV and CardDAV. Click on the *calendar/contacts* icon on the left hand side and the *gear* icon on the page that opens up, to set it up. In case you have multiple people who would be using your personal cloud, you can set up many user accounts by clicking on your username on the top bar and adding

users from the dropdown menu that comes up.

Besides all of this, you can also extend ownCloud's default functionality by installing custom apps. Click on your username on the top bar and click on *Apps*. This should open up a list of installable apps. You can also see some more apps on the ownCloud website. This is just a basic idea of what you could do with ownCloud. You could also turn it into a cheap, low power and headless cloud solution by installing a LAMP stack on your Raspberry Pi and installing ownCloud on top of it. So download it, get it running and get the cloud that you always wanted!
