

Ten Must-Have Open Source Apps for Windows

Open source software is available for Windows users. The benefits of using it are many: apart from helping you get your work done in an efficient manner, open source products can also save you additional expenses because they are either free or comparatively cheaper than their proprietary counterparts. Here are ten open source tools that can be used on a Windows machine.

It is common knowledge that open source software is not just for Linux machines. Open source is device independent. If you are using a mobile device, you can use the Android OS and its various apps. Even if you are using an iPhone, you can run numerous open source apps on it.

Open source is associated with freedom; so even if you are compelled to use Windows (say, if your company policy is to rely on MS Windows, or you are required to work with that one proprietary software which works only with Windows or for whatever reason), you can still employ open source tools for all your everyday computing needs.

1 LibreOffice

LibreOffice is the *de facto* standard when it comes to replacing a proprietary tool with an open source one. Almost everyone relies on MS Office for documents, spreadsheets and other related tasks. LibreOffice is an equally efficient software that comes with a word processor, an image editor, spreadsheet software, a presentation tool and various other features. The best part is that LibreOffice is totally free (MS Office, on the other hand... well, let's just say you will be saving enough to buy a modest computer if you switch to LibreOffice).
