

# BLAZE

THE AUTOMATED DESKTOP EXPERIENCE FOR

# Windows

Blaze is a small multipurpose utility that does the job of an application launcher and file searcher, and records macros for desktop automation. A special pattern detection feature separates this tiny utility from the rest.

**B**laze is an open source application available on Windows. Developed by Gabriel Barata whose interests lie in human-computer interaction, it is licensed under GPLv3. This utility performs similar operations to what others do, but does them better. It has an edge over the competition in every feature it supports.

Install the software (see *References*) and start Blaze. You

will find a new red mango shaped icon in the *System Tray*. To launch Blaze, press *Control+Alt+Space*. From now on, you will do more with fewer keystrokes! For many of the frequent operations such as searching the Web, emailing, calculations or file search, Blaze lets you skip the step of starting the application. You can directly begin to perform the intended action while Blaze picks up the corresponding application.
