Magimal Prakash in my opinion, it's not a good choice, because the system administrator should be enriched with experiences, thru their experiences only they become good system admin.

Avin Christopher Blegghier How are they supposed to get experience if not given a chance? You can't say you're experienced b/c you do this crap at home.

Magimal Prakash even if they managed to get a job that should be overseen by someone experienced in administration. You can't just walk in there, just because you know abt admin... Doesn't guarantee to be a good admin. Because admin should adapt to the situations, also you are responsible for sensitive information as well as assets of company. So freshers should be supervised by experienced people.

Raunak Malik But how are people supposed to get experience without actually being a sys admin? A good job for those who love computers and OS's
Like Reply · 3 · 22 May at 15:50

Alok Pal Oh Absolutely. Considering we have a few million Programmers and every other Btech and MCA Guy being a "Software Engineer", the demand for good sys admins has always been high.

Utsav Rana As a system administrator linux is somewhat to work with the computer/develop some softwares and also do some programming. It has a good choice to make a career in system administration but in the scope of linux is limited to the not more than wide spreader Microsoft, the job chances is very less often but makes a good sense.

Craig Evans I wish I was a sys, but I have no qualifications. I love working with different OS's and programming. I just love all things tech, if only some company would give me the chance, I would work 14 hour days for free to learn and become the best I could be.

Ramesh Gajaraju, senior manager, Information Systems, at Novell Software Development India Pvt Ltd

acumen and problem-solving techniques are the must-have skills for a sysadmin. Good sysadmins need to be constantly on their toes and must have the ability to resolve any IT related issue in a well-timed fashion. And the bigger the organisation is, the more systems related issues are bound to pop up."

IT professionals with a sound technical background have a better chance of getting a job as a sysadmin. "At Novell, we prefer candidates with an engineering/diploma background. Candidates with certifications like Novell Certified Linux Administrator also get a higher preference. That apart, we look for people who have some exposure to hardware and who understand how an operating system works. We look for people with the ability to adapt to the changes happening in the world of technology and expect them to upgrade themselves accordingly," quips Gajaraju.

Industry pundits also say that a systems administrator must ensure that the network infrastructure is stable, secure and is prepared to cope with any untoward problem. In a nutshell, a good sysadmin ensures that there are no interruptions in the functioning of a business.

And how important is prior experience in this domain? "It's not that we do not hire freshers in our company. We pick up freshers with a good engineering background for desktop support. But when it comes to back-end server support, we look to hire experienced candidates," says Gajaraju.

Experts believe that when it comes to systems administration, the curriculum of most of the colleges and training institutes in India is not aligned with industry standards and it's important to bridge the gap. "I believe that the institutes should design courses keeping pace with the changing times. The curriculum should be designed in such a manner that the students passing out are industry-ready," says Sharma.

According to Gajaraju, the average remuneration for a fresher is pretty satisfying. For experienced people, this would depend on the role and the size of the company.

The domain of systems administration makes for a promising field for open source experts. So, if you wish to get hired as a systems administrator, acquire some FOSS skills. **END**
