Nick Jamison:

I am a newbie to the whole Linux world. What are the differences and similarities between Linux and BSD. Which do you prefer and why?

Like · comment

Sky Convergence: I like Linux because it is immune from Windows viruses. I can insert flash drive on my Linux computer without worrying about getting infected of viruses from Windows.

Utsav Rana: UNIX is a server side operating system whereas Linux is the child version of UNIX. Ubuntu is based on Debian and the most preferred distro for newbies and home users.

Nick Jamison: Ok, thank you immensely for all the answers! I appreciate it!

Tripathi Satyesh: BSD/Berkley software distribution is a unix system that is free to use but its codes are not open due to its inheritance of code from unix.

Jason Gookstetter: Awesome question. Ubuntu is great for starters. You will see the word 'flavors' often. It's all preference. Your perfect version of linux is like a mutt :D, distro+desktop environment+eye candy+functionality = your preferred choice. I recommend LTS of any kind, stick with what works and modify from there. Modify/write an install script to fit exactly what you like once a distro is chosen and you'll find life easier.

Er Avishek Kumar: BSD also tends to be more stable, albeit much less bleeding edge than Linux. The FreeBSD team is really meticulous about software updates and release cycles. FreeBSD is also a lot more rough around the edges for most newbies to UNIX and UNIX-Like OSs. But put FreeBSD on an old computer and after stomaching the rather long bootup, you won't be displeased with its efficiency and stability. Plus installing everything from source code in FreeBSD is made easy via ports, which influenced Gentoo's emerge. Do not expect any hand holding or work being done for you with a FreeBSD setup man pages and the handbook are your salvation. With that said, stick to a Debian-based OS, such as Linux Mint, Ubuntu or one of the Ubuntu derivatives. At least until your horns are no longer green.

Aniruddha P Tekade:

I am a beginner in JAVA and want to learn how the projects are developed. So, is there any kind of documentation or video lectures where 'the stepwise development' of JAVA project is given, so that I can follow and learn to develop?

Masroor Ahmed Nizamani: For video tutorials, have look at the newboston youtube channel tutorials howtoprogramwithjava[dot]com podcasts Derek Banas Java tutorials. If you could have a look at Lynda.com's Foundations of Programming : Fundamentals, they have Java tutorials too. I am not professional programmer but let me give you some idea. First you have to learn programming language Rules/Syntax. And then how to use libraries try to make things break things as you progress you get an idea how to do things! Then learn Data Structure and Algorithm after that Design Patterns. And the most important thing in programming is all about practice so do not copy paste code always try to write it yourself.

Vikas Dwivedi: Refer updated books. Read and make notes using official Java documentation. There are also some online tutorials like lynda.com, thenewboston etc. But, I personally prefer reading books as many as possible because they give more comprehensive understanding. You need to have a deeper understanding about the language before taking/starting any project.

Nikhil Ikhar: <http://www.tutorialspoint.com/java/> is good place to start. First get familiar with basics of java in min required modules, then dive deep in any of them.

Bikramjit Mandal: Download and install NetBeans, then go to the website and follow a demo. But first of all decide what kind of project you want to do. All the best!

Apinder Singh:

Any distro which can work fine on AMD A8 4500M APU with Radeon HD 7640G+7670M graphics without tweaking?

Like · comment

Phani Kumar Veluturi: Check for CPU usage of applications using `top` / `htop` and for power use `"acpi -V" / "hdtemp"` use KDE instead of gnome.

Apinder Singh: Facing overheating problem with default installation of distros like Fedora, Linux Mint and Ubuntu.
