

The Android SDK will support in-app payments from both PayPal accounts as well as credit cards. As stated by John Lunn, global director of PayPal's Developer Network, "The new Android SDK is a native mobile payments solution that integrates simply and seamlessly into your Android apps, and removes payment friction so developers can focus on creating amazing experiences."

The kit supports all iOS 5+ versions on all iPhone and iPad screen sizes and resolutions. The developers would find it easy to integrate PayPal as it features a simple UI. With card.io credit card scanning, customers don't require an additional reader device. Also, PayPal Android SDK adopts a proof of payment system, which means you need not worry about PCI compliance.

Developers and users can interact on Google Play

Google is doing its bit to ensure that the developer and end user gap is bridged as much as possible. The search giant has said that from now on, all Google Play developers will be able to reply to user reviews. This is being done with the aim of strengthening ties between developers and users, which will help them work on improving their apps.

Commenting on the move, Ellie Powers from the Google Play team wrote in a blog post, "We're happy to announce today that all developers on Google Play can now reply to user reviews. You can reply to user reviews in the Google Play Developer Console, and your replies are shown publicly below the corresponding user review on Google Play. Users receive an email notification when you reply and can either reply to you directly by email, or update their review if they choose to do so — though keep in mind that users are not obligated to update their reviews. You can also update your reply at any time."

This is not very new to Google. Back in June 2012, this feature was introduced for top developers only. Now, after almost an year, the company has extended it to all developers. The company has also shared some guidelines on this matter with developers.

Now, Linux rocks on Chromebooks too!

Linux is leaving no stone unturned to expand its horizons. The latest kernel 3.9 version released comes with an interesting facet—

compatibility with none other than Google Chromebooks that run on the Chrome operating system. This is the first time that Linux coding has been embedded keeping the Chromebooks in mind, which clearly highlights the importance of these notebooks for the Linux community.

Every Linux user knows that a kernel is integral to the working of an open source operating system. It is mainly used for tasks like communicating with hardware and managing resources. Android also uses the kernel version just like the Chrome OS. But the difference in the kernel is what separates Android from the Chrome OS platform. To run Linux applications on Chromebook requires a higher-end kernel version. Recently, Ubuntu users managed to run the platform on Chromebooks using a customised version of the distro called ChrUbuntu. But from now on, users need not bother with customising distros as the drivers required to use a Chromebook are being bundled into the 3.9 kernel.
