

Google Play gets a fresh look

If you are a fan of the Google Play Store, here's news for you. The Store has got a revamped look and the search giant has rolled it out in the Indian market too. The latest version is 4.0.27. Those who have not yet installed the Play Store by using an APK can expect it to reflect on their Android device anytime now.

The redesigned store was first launched in the US almost two months back. Since then, the search giant has been fixing bugs and has also had two more minor releases in preparation for the mega release.

Linux Kernel 3.9 released

If you are a Linux enthusiast and looking for the latest update on your favourite OS, here is a piece of news for you. Linus Torvalds released the latest kernel version Linux 3.9. The version has been released 10 weeks after Linux 3.8 made its way to users.

Compared to the previous kernel, the latest version comes with a device mapper target that allows users to set up an SSD as a cache for hard disks to boost performance. Also included in the kernel is support for multiple processes that wait for requests on the same port. This is a feature that will allow the processes to distribute server work better across multiple CPU cores.

The kernel version also comprises KVM virtualisation on ARM processors, and RAID 5 and 6 support has been added to Btrfs's existing RAID 0 and 1 handling, the report added.

JBoss is now WildFly

With the scope of JBoss widening beyond an application server, it was time to keep pace with the changing times. So Red Hat has come up with a new name for it—WildFly. This development comes after Red Hat announced its plan to rename its widely used Java server last year. Many were quite surprised by this decision

back then, as the company created the JBoss brand name for open source applications when it was launched in 1999.

However, it is a well-known fact that 'JBoss' is part of the community portal JBoss.org, which is the application server itself and one of Red

Hat's middleware products. The company decided to implement the strategy of clear differentiation, which has already been seen for Fedora and Red Hat Enterprise Linux (RHEL). It is hoped that the change in branding will not lead to confusion among customers.

The JBoss application server will be known as WildFly from now on. The name has emerged as the result of a survey and voting process, which was conducted late last year. The name WildFly is meant to reflect the server's 'extremely agile, lightweight, untamed and truly free' nature.

Fedora 18 based Korora 18 'Flo' Linux distro released

Korora 18 'Flo', which is based on Fedora 18, has now been released. Back in 2010, the Linux distribution from Australia moved over to Fedora. And now, the Korora distro gets Korora 18, Flo. According to developers, this is the final name of the distro as no major issues were found during beta testing. Korora 18 comes in two flavours with a GNOME and KDE desktop.

Both flavours have an Adobe Flash plug-in, experimental support for the Valve Steam gaming client, VLC as the default media player and Firefox as the default browser. Users can install third-party software, as installation for Chrome, RPMFusion and VirtualBox have been configured.

Turn Raspberry Pi into a powerful computer for robotics

Launched by Roboteq on Kickstarter, RIO (Raspberry IO) is a Raspberry Pi-based robot navigation computer project aimed at creating an intelligent I/O card that stacks over the \$35 Raspberry Pi Linux Single Board computer. The RIO card includes a set of I/O and connectivity features.

Roboteq, the industrial partner in this project, said it would manufacture, market and sell the RIO card worldwide. The RIO card and the Raspberry Pi combine to create a powerful embedded robot navigation computer that is remarkable for its size, power consumption and price. Added to Roboteq's extensive offering of motor controllers, the RIO-based computer opens a world of applications in sea, land or airborne unmanned robotic vehicle applications, as well as in more traditional automation and machine control systems.
