

PhoneGap Application Development: A Developer's Delight!

In this era of mobile phones, developers are concentrating on building mobile apps rather than desktop applications. There is a huge variety of apps being published every day, which makes the mobile market very fluid. PhoneGap is a great framework for mobile application developers to work on.

In the world of applications, there is a kind of tug-of-war situation between native and hybrid apps. Native apps have an edge in using the native features of the device and give their users a better experience in terms of performance. On the other hand, hybrid apps offer tough competition by following the 'build once, use anywhere' policy, which lets developers make an application and run it simultaneously on various platforms. There are various platforms that allow hybrid applications the capability of using the native features of the device and of running the apps as native apps. PhoneGap is one such highly

appreciated framework that lets developers make one app for various platforms.

Getting started

PhoneGap lets developers make their apps using HTML, CSS and JavaScript, and packages those as native applications (.apk in case of Android) to be deployed in various mobile platforms like Android, iOS, BlackBerry, Windows, Bada and so on. In this regard, it makes the developers' job easier as they do not need to know platform-specific languages and can develop one app for different devices. It provides various
