

- Copy *pxelinux.0* from *syslinux*
 - Create a directory *pxelinux.cfg*
 - Move *isolinux/isolinux.cfg* to *pxelinux.cfg/default*
 - Move *android-x86.png* and *vesamenu.cfg* from *isolinux* into *android*, i.e., one level up.
4. To create a new *initrd*:
- Extract the contents of *intrad.img* into a working directory
 - Move *install.img*, *ramdisk.img* and *system.sfs* in the *mnt* folder of the working directory
 - Modify the *init* script to ignore mounting if */mnt/ramdisk.img* exists. E.g., a quick fix is to call *try_mount* conditionally in *check_root*:

```
if [ ! -f /mnt/ramdisk.img ]; then
    try_mount ro $1 /mnt && [ -e /mnt/$SRC/ramdisk.img ]
    [ $? -ne 0 ] && return 1
fi
```

- Create a new *intrad.img* and replace the one in */var/www/android*

5. Configure *dhcp* with the following line to boot *pxelinux* using *http*: filename "*http://server/android/pxelinux.0*";
- In my experiments, this worked on both the netbook and the desktop. However, *Android* is designed around a small device. So, using it on a desktop is an interesting experiment but certainly not worth frequent use.

The first lesson is that creating a customised *initrd* is not very difficult.

The more important and very noticeable lesson though is that the ease of use and the ability to just access an incredible amount of information comes at a price - the loss of security and privacy. The risk of owning such devices may be far too high if one is in the habit of leaving the device unattended! **END** 🐼
