

```
echo "Stopping VNC Server"
pkill Xtightvnc
;;
esac
```

10. Make the script executable, by issuing the following command:

```
pi@raspberrypi~$ sudo chmod u+x vncserver
```

11. Kill the previous instance of VNC server that started initially, with the following code:

```
pi@raspberrypi~$ sudo pkill Xtightvnc
```

12. To ensure VNC server is not running, use the code below:

```
pi@raspberrypi~$ ps aux | grep vnc
```

13. Start the VNC server via the startup script, as follows:

```
pi@raspberrypi~$ sudo /etc/init.d/vncserver start
```

You should see the output given below:

```
New 'X' desktop is raspberrypi:1
Starting applications specified in /home/pi/.vnc/xstartup
Log file is /home/pi/.vnc/raspberrypi:1.log
```

14. If you want the VNC server to come up each time you boot, execute the following:

```
pi@raspberrypi~$ sudo update-rc.d vncboot defaults
```

Reboot the Pi and you will see VNC server has already started.

15. On the host Ubuntu machine, install the VNC viewer, as follows:

```
#sudo apt-get install xtightvncviewer
```

16. Connect to the running VNC server using the IP address of Pi:

```
#vncviewer 192.168.1.yyy:5901
```

When prompted for the password, enter the password that you had set earlier to view the Pi's desktop. The graphical desktop of Pi will pop up on your host screen

17. To stop the VNC viewer, close the application. To stop the VNC server, issue the following command on the Raspberry Pi:

```
pi@raspberrypi~$ vncserver -kill :1 (Note the space after kill)
```

18. You can open multiple VNC connections. The display size of the Raspberry Pi's desktop can be adjusted by modifying the options in the `vncserver` command.
