

A List Of Virtualisation Solutions Providers

Cisco Systems | Bengaluru

SONA, which includes Cisco Network Virtualisation, encompasses both a vision for the evolution of enterprise IT and a pathway to get there. Cisco differentiates itself from most other vendors by adopting a systems-level approach that integrates services throughout the infrastructure. Looking at the Cisco Catalyst switching portfolio, it becomes apparent that a wide range of Layer 3 switches support network virtualisation. Other vendors have point solutions that are only applicable for limited areas within the campus network. Cisco Network Virtualisation is a primary component of the Cisco SONA framework.

Citrix Systems | Bengaluru

The desktop virtualisation system that centralises and delivers desktops to users anywhere, reduces desktop TCO by up to 40 per cent and improves data security by centralising desktop management. XenDesktop delivers a high definition user experience and personalised desktops over any connection.

Dell | Bengaluru

The solutions from Dell can help provide a flexible infrastructure for the data centre by providing access to data for remote and mobile workforces using desktop virtualisation solutions. With virtualisation, you can count on an approach that meets your growing needs. It will increase an organisation's ability to meet evolving business requirements by leveraging existing resources and scaling the infrastructure without the need to rip and replace. Dell focuses on standards-based solutions, keeping the barriers to change low. With Dell, you will not be locked into proprietary hardware implementations or management frameworks that may limit your options in the future.

Hitachi Data Systems | Mumbai

Hitachi Virtual Storage Platform is the only 3D scaling storage platform designed for all data types. It is the only enterprise storage architecture that flexibly adapts for performance, capacity and multi-vendor storage. Combined with unique Hitachi Command Suite management software, it transforms the data centre.

HP India | Bengaluru

The Client Virtualization Access Service of HP provides multiple network access, flexible role-based access, a user-friendly interface, and a secure printing network—all from a single access device. Using this unique technology as part of a client virtualisation solution, HP can provide a unique user-focused interface to internal, secure, desktop, or cloud network resources—all from a variety of endpoint devices—ranging from desktops to tablets.

IBM | Bengaluru

IBM Virtualisation provides a logical rather than physical view of data, computing power, storage capacity and other resources. IBM System Storage virtualisation helps provide centralised data management, reduced complexity, and reduced costs. The IBM SmartCloud Virtualized Server Recovery service can help reduce your recovery time and improve the reliability of your recovery infrastructure.

Intel | Bengaluru

Hardware-based Intel Virtualization Technology (Intel VT) improves the fundamental flexibility and robustness of traditional software-based virtualisation solutions by accelerating key functions of the virtualised platform. This efficiency offers benefits to the IT, embedded developer and intelligent systems communities.
