Vinay Gowda:

I have installed Ubuntu 12.10 on my lenovo(G580) laptop, but the network(wired) is not up. Can any one help me?

Like · comment

Riya Patankar: Have you tried running `ifup eth0` or `dhclient eth0` as root?

Avinash Kumar Chaurasia: What does it say? Possibly your ethernet is not supported. First check the ethernet specifications. Then install ethernet driver for your hardware.

Vinay Gowda: `ifconfig eth0 -> eth0: error fetching interface information: Device not found`
`ifconfig eth0 up -> eth0: ERROR while getting interface flags: No such device.`
Even I tried to install the drivers, but none of them are working.

Avinash Kumar Chaurasia: I don't know what drivers you are trying. It must be hardware specific.

Spencer Allen: I recommend investing in a USB Wifi adapter. Sometimes the Kernel needs to be patched in order to support the latest hardware. It seems to happen most frequently with networking adapters and it can take a long time for the Kernel patches to get developed and make their way to the various distros. So having a network adapter that you can plug into any machine that is already supported is a huge bonus. Here's a list of currently supported USB Wifi adapters to choose from. <http://wireless.kernel.org/en/users/Devices/USB>

Safiyat Reza: I want to build a custom system based on GNU/Linux for use by (primarily) my parents and friends (almost all novice). Which Linux OS should I start out with, to build upon it? Please suggest a small, all stripped OS, which is rock solid stable, so that I only will have to custom compile and build the applications on it. Suggest a powerful base system.

Spencer Allen: What you described is Arch. https://wiki.archlinux.org/index.php/The_Arch_Way

Riya Patankar: It's better if you opt directly for Pear OS.

Jatin Khatri: Is it something like <http://www.linux-fromscratch.org/>?

Muthura Startx Aiviwe Musa:

How do I install WVDial on Backtrack 5 R2 offline?

Like · comment

Riya Patankar: Go to the backtrack repo site, search for the package, download it and install it. It has some dependencies- approximately 3 (as far as I remember).

Muthura Startx Aiviwe Musa: Riya, thank you mate.

Bera From-Vindhyanagar Somnath:

Is there any way to install Arduino IDE on Raspberry PI? Any research anywhere?

Like · comment

Binoy Xavier Joy: Yes you can. Enter `sudo apt-get install arduino` in terminal.

Bera From-Vindhyanagar Somnath: Thanks, but on my wheezy linux Raspberry Pi, it's not working.

Binoy Xavier Joy: Update first and then try. Run this first. `sudo apt-get update`.

Bera From-Vindhyanagar Somnath: Even then ...it says unable to locate package arduino. Yes... it works now... Thanks!

Ashwith Rego:

Is there a way I can make Gnome 3.4 extensions work on 3.6? The Axe Menu extension is really neat but the developer hasn't updated it for Gnome 3.6 yet.

Like · comment

Riya Patankar: Go to the json file of the extension and replace 3.4 with 3.6.

Ashwith Rego: Thanks! I was able to enable the extension with that but it looks like there is still a problem. If I click the menu once, it works. After that, every subsequent click opens the Documents directory.

Riya Patankar: Search the same extension on extensions.gnome.org.

Ashwith Rego: I did. The developer is yet to update it for Gnome 3.6. It worked fine on 3.4.

Riya Patankar: Then, that's your hard luck. Either search an alternative or wait for its update.
