

Ubuntu phones to hit stores in October

It's official! The much-awaited Ubuntu-based smartphones will make their debut in October. It has been confirmed that the first lot of Canonical's Ubuntu Phone OS-based smartphones would arrive in the market by October this year. As reported by the Wall Street Journal, Mark Shuttleworth, founder and CEO of Canonical, has stated that the Ubuntu smartphones will be "available in two large geographic markets in October 2013." Meanwhile, app developers can run the Ubuntu Phone OS on the Samsung-made Google Nexus smartphone.

For developers, the Ubuntu Phone OS supports both native and Web or HTML5 applications. Web apps are first class citizens on Ubuntu, with APIs that provide deep integration into the interface. "HTML5 apps written for other platforms can be adapted to Ubuntu with ease, and we're targeting standard cross-platform Web app development frameworks like PhoneGap to make Ubuntu 'just work' for apps that use them," the official post states.

Unlike Android, the Ubuntu Phone OS doesn't include many screen buttons and depends mostly on edge swipes.

You can now run Android natively inside the Windows OS

Wish to enjoy the complete Android experience on your Windows PC without a glitch? The developers at Socketeq have now made this possible. You can run the Android OS inside the Windows OS. The developers have made their software, WindowsAndroid, available for testing.

WindowsAndroid runs Android on the Windows kernel instead of Linux. It is an ultra-swift transition because it takes away the emulation layer which is present otherwise. WindowsAndroid currently works with Google's Android 4.0 (ICS). All you need is the knowledge of how to work with the Android OS beyond its standard smartphone housing. So, if you are someone who has never hacked a smartphone or tablet before, do take your time to try this one out. But if you wish to try it out, you

LibreOffice 4.0 released

At a time when Microsoft is planning to bring out Office for Linux, LibreOffice has reached its version 4.0. The new LibreOffice has been released by The Document Foundation. It has several major improvements, like API changes and support for the Content Management Interoperability Services (CMIS) standard. The new version also has better import and export of native file formats for Microsoft Office programs, along with further improvement of Visio import filters with the addition of the 2013 version.

One major addition in this release of LibreOffice includes the first release of Impress Remote Control App for Android, which is currently supported by some of the Linux distributions. The second release of the app is expected to arrive soon, which will be supported on all platforms—Windows, MacOS X, and all Linux distributions and binaries. LibreOffice Impress Remote is a free remote control app for presentations. With this, you can control your LibreOffice presentations from your Android smartphone.

The new version doesn't include many changes in terms of visual appearance, compared to the 3.6.x LibreOffice series. However, LibreOffice 4.0 comes with several tweaks in its user interface. The dialog boxes in this release are rendered. Other additional improvements in the user interface include Unity integration along with support of Firefox Themes (better known as Personas), which gives LibreOffice a personalised look.
